you are missing a big point of thing desk top,the idea is to set
it up so that the files that you double or even single click on
are sent into the applications that you want them to go to,you can
even have a choice of apps presented to you in case you want to do
different things with the file

I've been using v2.03 for a while. It had trouble with some WAV files but
v2.04 seems to play them OK now. AVIs. MOVs and MPGs are all fine.

I was intrigued to see RealAudio supported but I can't get it to play any.
All the files I've seen have RM extention not RA. I changed to filename
but all I get is 'unknown file type'. What's the difference between RA and
RM files?

Actualy, that depends on if HS-Modem is there and which settings it has.

> TOS 3.** may default to the lan port - but no one is going to be
> using this set up for accessing the web/internet to begin with.

Why not? it is a perfectly safe and efficient port. I love it.
Works great for Mac modems also (though I haven't verified that).

> If I enable 230400, my 33.6 modem does not see it as a valid rate,
> so I have to assume that the port speed of Serial 2 has been altered.

Actualy, most modems don't swallow faster than 115200 and some people,
especialy on Falcon, report that beyond 57600 the connection looses
too many packets.

Actualy, if you use a DTE speed of 2x the modem's DCE or better,
you'll benefit form the modem's hardware compressions. ;-)

BTW, not sur of your Zoltrix' model number, but mine was upgraded
to 33.6 for free. Slightly faster connection. ;-)

Unfortunately, the upgrade has to be flashed using a PC......

Some versions of CAB.OVL indeed support downloading a single
file through FTP protocol. However, it still doesn't display
a directory as a page with clickable links and description
(which is a BIG plus of Netscape and other browsers).

TT doesn't have 57600 nor 115200 on Modem2.

Yes, I know, the MEGA-STE and Falcon have those rates, but the TT
was Atari's first experiment with the SCC technology.... ;-)

Unfortunately, history has it that 76800 and 153600 did not become
wide-spread standards, but Uwe Seimet and a few others have modems
that recognize those speeds.

Specifically, Cubase won't like clocks, and fonts, and item selectors. All these conflict with the design of the program.

Cubase doesn't like clocks running because it needs to listen to MTC and SMPTE.

Cubase doesn't like fonts because of the scoring module.

Cubase doesn't like replacement item selectors because it has it's own which isn't great but specifically allows you to save on the fly while the song is playing.

Anyone (me for instance) can copy the required disks for you as they are useless without thedongle/key.

Stephen

I've had problems with Cubase running on an STe with 4 meg of ram, 1 floppy, 1x 20meg SCSI HD and a Mono monitor (TOS 2.06). Nothing else installed, just cubase and that annoying dongle. You can't get much cleaner than that.

Most of my problems occur while scoring or arranging a large score in particular. I often work with around 20 midi tracks and some of them are quite busy - especially the piano parts. Start adding lyrics to a page and move a few things around and wierd stuff happens.

Typically, positioning of objects will become eratic and the objects seem to place themselves in strange places.

I've used the PC equivalent - at least a pentium 133 with 32 meg of ram responds reasonably, but even that version I have found some interesting "features".

The Mac version of Cubase seems to be reasonable. At least if you buy the Mac version Steinberg seem to respond to support calls.

: My ST has just decided to delete an entire disk of valuable text files. How
can
: I undelete these? Is there a utility availanle anywhere? It's been a very
long
: time since I used by ST so I'm very rusty.

If this is not one of the rare times that a FAT got written in the wrong place, making the disk useless, or one of the times that all is left is a disk full of null characters, there are several approaches, and some of them depend on "what disk". One can use a disk editor, and search for the last seven characters of the name of the deleted file, and, having found it, save that sector back to disk with the right first file name character. This is not for beginners.

Disk Doctor has been out of print for many years, and can undelete files on some disks, and there are some other undelete utilities on archives.

The problem is that most of them were written when a sector was 512 bytes. They do not know what to do with bigger sectors, and I am using, I think, 8196 byte sectors.

What I am using is Diamond Edge, which is commercial. It is still available from whoever bought the source code when Oregon Research folded. It has done occasional undeletes on some very large sectors for me.

If you are dealing with a floppy disk, there are many solutions. E-mail me and I can send you one or more, uuencoded.

t>
t> Personally I use STDATA a database program that came bundled with
t> the Atari. An old but very efficient program that you can
t> customise/design databases with.

I find the old CONTENTS.TOS (in most PD libraries) vry good as it formats folders and their contents nicely for printout. You might also like to try the cataloguing function in the new FINDER.PRG, available from InterActive or Derryck Croker's web page. Note that neither assign an ID to the disk - you have to do this in the filename (changing CONTENTS.TXT for the former from the desktop). If you want a database of all/many disks then the suggested STDCAT is the best bet.

Regards
/Peter/

j> good as when a 300 dpi printer (such as a HP LJ4L) is used leading me
j> to suspect that edge enhancement has been turned off. If I knew the
j> command to turn it off and on I could modify one of the drivers.

I don't know if this helps, but the file listing PCL-5 commands gives:

---QUOTE---
RESOLUTION ENHANCEMENT

Esc%-12345X@PJL DEFAULT RET = OFF, LIGHT, MEDIUM OR DARK <CR> <LF>
Esc%-12345X

NOTE: On the LaserJet 4Si / 4SiMX the variables
are ON or OFF only.
---UNQUOTE---

Don't ask me how you use this - that's all it says. I got it from a series of files named LJ1202.ASC to LJ2079.ASC which details all the PCL-5 commands - it's in a file PCL5.ZIP I found somewhere. If you want I could email it to you UUEd or MIMEd - tell me which.

Regards
/Peter/

The same thing goes for TOS, but at least I can double click a file in that if it's an ASCII one and it is shown to me, rather than trying to set up an app for it. Fine you can set up an app, but it should at least ask you first if you want to try and read it. I have lots of text files with different extensions and I am not friggin setting up each one.

AM.

I think therefore I AM.

(L> text files. How can I undelete these?

STTools and Diamond Edge both have undelete facilities. STTools is shareware and has always worked fine for this. DE is commercial; also works fine. There was an undelete.ttp with KnifeST which also worked fine, if you get along with ttps.

It may be that the disk itself is trashed; but there still may be a way out. Damien Jones wrote a prg called DiskFix (I think). I have never had much success with it myself, but if all else fails, you could give it a try. Email me and I'll send it (I have it on the SuzyB's CD - I don't know where else it might be).

Try setting up 1STGUIDE.ACC as your default (entered as *) and it will
show all files that are not otherwise assigned to an app.

Keep in mind, the ST only does 8bit audio, and at pretty low frequencies to boot.
It's fine and dandy for games, but for pro music? Well...if you want the 8bit sound for some reason,
your best bet is to post to news groups like this one looking for a used sample cartridge. You may also find that some dealers might still have Clarity, replay, or some other sample packages in stock.

Do a lot of web searches on Atari, Atari Dealers, etc, email them, and see what they have left over :)

No need to set it up for each extension.
Just set the default application for *.* to a viewer like textview or
1stguide.
Then each ext for other applications.
example:

. > textview
*.rsc > interface
*.gif > apexgif.ttp
etc etc
everything will go by default to the *.* assignment unless specified.

Only if your ISP provides an FTP proxy and you set CAB up to use it. CAB's download module is for background downloading of file via HTTP from web pages, it doesn't do FTP AIUI. Late model versions of CAB (2.6 onwards I believe) come with Fiffi, an FTP client which only works with Iconnect: ISTR that this wasn't exactly trouble-free either (from some discussions in here a while back).

The FTP proxy solution does work very well, though, if available.

Spencer,

I use MagiCPC myself - and it is the main Atari I use now - the Falcon hardly gets switched on!

However, in answer to your question I do not know how it compares to any of the other emulators... TOSBox looks good, but I haven;t tried it for ages - although I have heard it is TOS compatible at times where MagiC isn't.

As for Gemulator - you can run Magic under that.

PacifiST is good if ya wanna play games...

As I haven't used anything apart from MagiCPC really I am unable to answer your question in any qualified manner.

Regards
Danny

Source record: 88788

The very first Manchester Atari Club meeting will be taking place on Sunday 10th January, 1999.

It will be taking place at 42 Painswick Road, Woodhouse Park, South Manchester, and is very easy to get to via Bus, Train and Motorway.

Directions:

By Train:

Get a Train to Manchester Airport, and catch a 43 bus. Ask to be dropped off at Painswick Road. Walk up Painswick road, and it's number 42.

By Bus:

Get the 43 between Manchester City Center and Manchester Airport, ask for 'Mountain Ash', and ask the driver to tell you when you are there. Walk up the road, and you will see Painswick Road on the right. Walk up Painswick Road, and it's number 42.

By Car:

Get onto the M56 and turn off at Wythenshawe. Turn LEFT at the junction, and take the first RIGHT. Follow the road down, and look for Painswick Road on the right. It is after the Mountain Ask pub, and after 2 roads on the right. Go down Painswick Road, and it's number 42.

There is no membership fee, and everyone is welcome to attend. You are invited to bring your Atari machines to the meets, but please tell me if you are bringing a macine so I can make room for you.

Features for the show:

Showing of new software and hands-on demonstrations,

Atari Help clinic answering all your queries and fixing any problems you have,

Swapping of software,

Internet help and use for anyone that wants to know more about the net,

Multiplayer games,

and many more!

I hope to try and get a multi-atari network set-up so more than one machine can access the internet at the same time.

If you wish to attend, please let me know so I know roughly how many people are coming.

For more information, please email Simon Osborne at simon@carbon.dnx.co.uk or you can write to MAC, 42 Painswick Road, Woodhouse Park, Manchester, M22 1GG

I look forward to seeing you there.

although I don't have a PC here myself to give you a hands-on
experience, I know that our club Librarian has run TOSBox on his PC and has
been mostly positive in describing how well it works to me. Apparently
Calamus runs quite well under TOSBox.

BTW, TOSBox also works under SoftWindows '95 on the Mac. My brother
and I actually loaded up and ran it under SoftWindows running on one of
the faster PowerBook G3s, and it ran very respectably. (We also forgot to
remove the program or quit it when we shut the Powerbook off. Guess
which desktop showed up when the Powerbook's owner saw when he turned
it on the next morning :))

I've run Cubase 3.1 (legitimate with dongle) on my STe (4 meg ram) for a couple of years and found it to be very buggy. Bombs, complete lock ups and just plain strange behaviour in the score arranger.

I've gone back to KCS Omega for my sequencing work because I find it more convenient and stable. Notator is a nice package but I don't have it. I do have Notator Alpha - but only because I got ripped off by somebody selling it as Notator. You live and learn.

Does anyone know where to download the program "PacifiGUI 1998"
written by Jonathan McHugh.
This program is a Windows graphical frontend interface for the
program "MakeDisk" which makes Atari disk images for use with
Atari emulators such as "PaCifiST".

All the Atari related websites who have links to this program
have the address as:

http://www.mchugh1.demon.co.uk/

but I just get the message:

DNS Domain 'www.mchugh1.demon.co.uk' is invalid: Host not found (authoritative).

Does Jonathan McHugh have a new website?
I've tried searching for "pacifigui" and "jonathan mchugh" using various

Bit 7 in #_FLG in Magic.inf (64)
Easy to set up with MagicSetUp or equivallent.

Hi Andrew,

Yes, I know what you mean, and I have not bothered to encourage my pupils to register their recent copies as I find it easier to help them myself. However, I was quoting from a reply I had from Dave Nicholson, Steinberg's product manager, when I complained about the updates not being available on the steinberg.net site.

I think that at least Steinberg would replace faulty disks over here, whereas they don't even bother to do that in the States.

I was quite surprised to see Steve Rollinson's comments about it being a buggy programme as I have used it on a Mega ST, an Ste, a Falcon and now the Hades, all without any significant problems. I would recommend as clean a system as possible, Cubase does not like some of the extras I use on the Hades like WINX, and I have never used it with any multi-tasking set-ups.

Cheers

Paul

Hello,

I just finished my work on the UTSI pages. By the time you read this
they should be on the Net.
Take a look at http://www.ping.be/~ping1030/atari/prg-ind.htm and tell me
what you think.

I've done quite some work on it so it's most likely there will be some
faults.
Please if you find something wrong let me know. I'll correct the fault
ASAP. Also if you know a prg that's not listed on the UTSI tell me and
I'll make a link.

Kind regards
Martin

Wow! Just downloaded this and tried it on some AVI and MOV files I brought
home from work, and they played!!! One of them was the 4.6Mb Star Wars
trailer of the new film. Played fine on my Falcon with just the odd frame
being missed out. But considering I play it at work on a Pentium2 350 and
I'm comparing it to my Nemesised Falcon, I think that's still amazing!
Well done on a brilliant program Didier. I shall now read the docs and see
about registering it :-)
BTW. It played *most* of my WAV files too. And also Terminator Baby AVI.
Brilliant!!

All remaining Steinberg Atari software is at

ftp://ftp.steinberg.de/UPDATES/atari/

These are obviously copy-protected and useless without a dongle.

The MROS update is worth getting if you've never bothered ... it's the final version ... ever :(

BUT

The Cubase and Cubase Score directories are empty!! (But not the CAF directory)

I will email Steinberg and let you know ...

jim

4025. FS: ST ITEMS

Newsgroup: comp.sys.atari.st
Date: 1998-12-05 00:00:00 UTC
From: sanskrit <sanskrit@usa.net>
Message-ID: <36687B48.40ECF0B1@usa.net>
Source record: 88837

Hi,

I have the following ST items for sale. Please contact me if interested.

(1) ONE ATARI MEGAFILE 30, $60
(2) TWO ATARI SM124 MONITORS, $50 EACH.
(3) ONE ATARI SC1224 COLOR MONITOR, $60.
(4) SLM-804 LASER PRINTER
(needs toner, probably needs drum to be replaced) $FREE !! (see
below)

considering selling the following.
(A) SPECTRE GCR, make offer
(B) HAPPY CARTRIDGE, make offer

The megafile, monitors and SLM-804 are in excellent condition. The
Spectre and Happy Cartridge haven't been used for about 2 years. They
worked the last time I used it. However I do NOT have any documentation
for those 2 products. I expect the buyer to know what he/she is buying
before any purchase takes place. I will consider reasonable offers.
SHIPPING is EXTRA.
As for the LASER, since it would cost a lot to ship, it can be picked up
at my home
or I am willing to drop it off anywhere within 2 hours of where I live
(near New York
City) I will just charge a small amount for gas and tolls.

Thanks.

I don't know much about Cubase but as you said that one must use an "as
clean as posisble system" sound this for me that Cubase isn't written very
cleanly. Every very well written prg runs on very machine. Take for
instance the old database "Superbase pro". I've use it on a ST1040, Mega
4 and TT030. It even runs on the Hades using the N.AES/freeMiNT
1.15.1-0.3.. Mono or 24 bit color it takes it all.
I saw Cubase running on your Hades and it had indeed some (minor) problems
with N.AES and under plainTOS using Winix.

Hi Jim,

I hope you get a reply from Steinberg, Dave Nicholson has only ever replied to my mails to the mailing list - private mails seem to get lost in the system !

This is what he said when I asked him about the missing Atari files (I was referring to steinberg.net at the time as I had not managed to logon to steinberg.de)

>>>In America we don't support Atari Cubase, because we don't ship it in
>>>America.

>>>That's not the case in other places, we still ship irregular small
>>>quantities in France & the UK, the home address of the classic Atari
>>>devotee, and offer support for these products.

>>>The FTP tree is being re-organized, the Atari files will replaced, but
>>>the product we still ship is the Cubase Audio Falcon, in statistically
>>>relevant quantities, and the CAF files are there.

Maybe if a few more Atari users contact Steinberg the files may get replaced a bit quicker, who knows ? Meanwhile, if anyone else would like to see if the Cubase and Cubase Score files are on steinberg-us.com that would be useful, as I have not yet managed to logon - they seem to be a very busy site.

Cheers

Paul

You are missing the point, the idea is to just be able to have the option
to try and read a file by double clicking on it, it's not such a hard thing
to ask for and I don't see why I should need to set up an external program
to do this when TOS has done it for X years.

Hello All,
If developers really want to rock the TOS world they should build a system motherboard designed for a PowerPC and rewrite Magic to run in PowerPC native mode, then write an emulator to have a virtual TOS 68k machine in a window. And why not a virtual DosBox in a window too (doom, quake, heritic, etc. dos games). People want faster computers, but want there old software as well. At some point there has to be a fresh start. I am not a fan of intel cpu's but I don't think any 680x0 chip is going to out perform a 450 Mhz Pent II. Even if it was possible to clock a 68060 at 400 Mhz or more. The 680x0 family has been around for may years and it is an exelent cpu but there are faster newer designs to be implemented. (multiple RISC?) One of my computers is a 200 MHz Pentium with winblow 95 and I can run the TOSBOX emulator to emulate a 68000 ST at 800x600x16 colors at about 10 times the speed of a standard 8 Mhz STfm That probibly about as fast as a TT (don't flame me, I'm guessing) My 16 Mhz Falcon with 14 mb ram is not very snappy with Magic/NVDI/STing/CAB 2.7 and what not browsing the web by todays standards. I enjoy using the computer though. Anyway, the thought of a PCI based system with a 300 MHz PowerPC running MagiC/Thing in native mode is cool. I would like to see something like this.

From owner-stnews@lists.toad.net Sun Dec 6 00:31:35 1998
Date: Sat, 5 Dec 1998 17:50:15 -0500 (EST)
From: Atari Central <acentral@beast.toad.net>
To: stnews@lists.toad.net, jagnews@lists.toad.net
Subject: [Toad Computers ST News] Own atari.net and ataricentral.com
Reply-To: info@toad.net

Toad Computers is no longer in the Atari business, we're sad to say. Lack
of supply of products has forced us out of the business, and we've moved
on to other things. We have not supported Atari products since late 1996.

We still have a great deal of fond memories of and affection for the Atari
community, however, and want to make sure that our Internet domain names
are carried forward by an avid Atari enthusiast.

So, we're contacting you first. First, take a look at the site.
www.ataricentral.com/www.atari.net are POPULAR sites with a LOT of
traffic.

- 150MB/day traffic
- 9,271 Requests Per Day (average)
- 8,686 Distinct Hosts served since December 1
- See the stats yourself at http://www.ataricentral.com/stats

The site, and the domain names ataricentral.com and atari.net, are being
auctioned at Ebay. The auction closes in 3 days. Whoever has the highest
bid at the end of the auction will walk away with one of the most visited
Atari Internet sites, ever. Bids are starting at $132.50.

You can bid on the sites by visiting:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=46202978

** What do you get? **

Atari.net, Ataricentral.com transferred to your company or personal name.
You also get complete access to all files associated with both sites
(about 50Mb of product graphics, etc.) You can also continue to host
either or both sites at ToadNet, our new venture, which has become one of
the leading Internet providers in the Washington, DC area.

We're looking forward to seeing the Atari vision carried forth, well into
the future.

Sincerely,

David Troy

Well, as I remember from his letters to e.g. the German computer
magazine c't and his articles in maus.*.atari.* and de.* groups,
Alexander Clauss dislikes implementing proprietary technology such as
Javascript (Netscape only) or ActiveX (Outlook "Express" only) very
much.

Additionally, both these technologies are security holes, intelligent
users of both browsers are supposed switch them off anyway.

As far as I remember Signum (and Script which is what I dealt with)
used different fonts for printing to different types of printers. I
will try and look out what I have and send them to you.

Message-ID: <366a6586.4759229@news.demon.co.uk>
Source record: 88706

We've had a few people ask if DeskTracker - the desktop mod player, and Storm Tracker - the GEM Mod editor - are still available.

The answers is yes. The shareware versions are availble to download from our site, and registration can be done on-line by following the links from the site, or the links included in with the download. Postal registration details are also on the site, and in with the download.

Both products still work on all models of Atari ST/F/FM/E TT and Falcon. We've also had them up and running on the PC emulators, and they should work on compatables (although we haven't been able to get one to try.)

For more information please either visit the Web site (please do, it would be nice to know that Atari people call past for a look), or E-mail me on the address below.

Seasons Greetings to all.

The manual suggests a shareware fee for CoNnect itself of 60DM, which
includes the manual in TeX format on disk, and 30DM. for a separate
printed copy. I think these come out at about 30ukp and 15ukp
respectively.

I have made a list of all the things I have in boxes from earlier upgrades and looking to trade them for something I might like or could find useful.

Cases:
External scsi 1 case - plastic w/ power supply
Dual under monitor Scsi case - Metal, Scsi 1 & 2 cables w/ power supply
Paradisk 350 - par port IDE HDD plastic case w/ drivers for dos, OS2 & 95

Cables:
Too many to list here (I have a huge assortment of cables, please email me if
you are looking for a certain type.)

Drives:
Quantum 250mb scsi HDD (apple) - 3 1/2
Maxtor 7345sr scsi HDD - 3 1/2
Teac 1.44 floppy drive FD235HF
Seagate ST-225 MFM 20mb HDD - 5 1/4
HP C1534 2gig scsi DAT tape backup
Quantum 230mb scsi HDD (apple) - 3 1/2
Quantum 2110s fireball 2gig scsi HDD - 3 1/2
Creative Labs Mitsubi 1x cd rom - uses Caddy (included)
NEC CD 84JD-I scsi 2x cd rom - Uses Caddy (included)
Western Digital 210meg IDE HDD - 3 1/2
(5)Seagate ST9385AG 420mb IDE HDD- 2 1/2 laptop drive
(3)Seagate ST9655AG 540mb IDE HDD- 2 1/2 laptop drive
Conner CFL350A 350mb IDE HDD- 2 1/2 laptop drive

Modems:
Practical Peripheral PM288MT II v.34 - external 28.8 modem
US Robotics 14.4 fax/modem internal - ISA
Intel fax/modem 14.4 - Pcmcia (missing adapter cable)
(2) US robotics 33.6 fax/modem internal - ISA (PNP)

Network:
Xircom PE3-10BC - Par port ether adapter
3COM etherlink III 3c589 - pcmcia ether adapter w/ cable for both TP & BNC
(2) Intel Ether 16 card - ISA (PNP)
IBM token ring card Turbo 16/4 - ISA (PNP)
SMC 16 bit ether card TP - ISA

Processor:
486dx2/50 w/heat sink
Intel Pentium 60

Mother boards:
486dx2/66 VLB MB w/ 256k cache - includes processor and 16meg of ram
Pent 100 PCI MB w/256k cache - includes processor and 32meg of ram
486sx/25 ISA MB w/128k cache - includes processor and overdrive socket
486dx4/120 VLB MB w/256k cache - includes processor and 16meg of ram
(2)IBM Opal 486slc/33 ISA MB w/?cache - includes processor and
co-processor socket
ALI 386dx/40 ISA MB - Includes processor
Haedland 286/16 ISA MB - includes processor

Input devices:
Touche mouse pad - ps/2 style with drivers
(3) MS mouse ver2 - ps/2 (PNP)
Micro Spped PC trac - Bus trackball (bus interface)
(2) MS mouse ver2 - serial (PNP)
HP mouse - ps/2 (PNP)
Gravis Phoenix 1010-1 Flight & Weapons controller system

Video Cards:
Oak Technologies 512k svga card - ISA
Diamond Stealth 64 svga card w/ 4meg ram - VLB
Cirrus Logic 512k svga card - ISA
S3 2mb svga card - VLB
Cobra Elite AT with spectrum upgrade (CAD card) - ISA

Sound Cards:
Media Visions Pro audio 16 PAS16sl - ISA
(5) Aztec 16 bit sound card, Sound blaster compatible - ISA (PNP)

Cards:
Micro speed bus card - for bus mouse and trakballs - ISA
IK 2nd&3rd Par port card - ISA
IK 3rd&4th HS serial card - ISA
(4) KW Multi I/O 16bit cards - ISA
Promise IDE & Floppy Cache controller w/16meg of ram - VLB
IK Multi I/O controller card - VLB

Scsi Cards:
(2) Adaptec AHA-2940 scsi 2 controller - PCI (PNP)
Ultrastor U14f Scsi 2 Cache controller - ISA
Adaptec AVA-2902I scsi 2 internal only controller - PCI
16 bit scsi card external only - ISA

Memory:
(25) 256k memory chips 16pin dip
(2) 4meg 72pin simms
(4) 8meg 72pin simms
(1) 16meg 72pin simms
(11) 1meg 30pin simms

(8) 256k 30pin simms

Switch Boxes:
Black Box A/B Switch Box - 25db female
HD15 AB switchbox 2 position - for VGA/SVGA monitors

Keyboards:
Gateway 102 key - ps/2 style
HP 102 key - ps/2 style
Gateway 2000 programmable keyboard with drivers - ps/2 style

Other:
Compro internet digital camera kit w/ software - Par port
Intel netport express xl print server 2 par & 1 serial
Targus notepac laptop case Model# CN01
(10) Windows95 full OEM version CD's w/ manuals (sealed)
(10) Windows98 full OEM version CD's w/ manuals (sealed)
(11) Microsoft Hom Essentials Software Bundle (sealed) - includes MS money,
Encarta 98, Word 97 and Hallmark greetingcard software
Viking DLE-200a ring down unit

A p p l e S t u f f

Keyboards:
Apple extended keyboard II - ADB (older version before the cheap ones came out)

Not sure if version 6 is out.

I use MagiCPC (1.2, which runs MagiC 5.11) but haven't tried any of the other emulators, so I'm reluctant to advise one way or another: MPC seemed to be the best bet for me as I used MagiC on my STE.

Unfortunately I've spent rather too long trying to get the PC working properly (no sniggering at the back, there!) to have done extensive testing of MPC, but I have Calamus SL (patched 93), Papyrus 5 and CAB 2.5 working, though Calamus is only really happy at 256 colours and CAB at 16M. I do get pallette re-draw problems, but this may be a graphic card/driver problem if the docs are to be believed.

One thing I would advise: don't even think about using it without NVDIPC, as without it MPC is limited to 16 colours and graphics are *slow* (this is on a 300 MHz PII). When it comes to speed in general, it's *much* faster than the STE, no idea how it compares to anything else. For example, unzipping a largish archive (eg 600k) with ST-ZIP is almost instantaneous, where it would take an age on the STE. On the other hand, CAB and Papyrus do still seem slow sometimes compared to native Win95 stuff, but I guess that's predictable.

Other quirks which I wasn't expecting (if anyone else has any ideas on these I'd be interested):

Aliases (symbolic links) don't work with mapped folders as drives (ie using the PC's file system directly): they do work with RAM disks and drive containers. Seems a shame that they haven't managed to use WIn95's

shortcuts as aliases.

It seems to be impossible to get to the program manager as the key combination involves pressing CTRL and ESC together, which automatically calls Win95's Start menu no matter what.

Sound support seems to be limited to the odd beep. Even programs which don't need DMA sound don't seem to produce anything so far, which I had thought would be OK, not that it's a major problem.

Do _NOT_ use *.* in Thing if you want to cover all files. Thing uses
UNIX-like wildcars, which means *.* will only match files with at least
one dot in the name (e.g. readme wouldn't match *.*). Use * for all
files.

Ciao

Windows shortcuts are completely useless for emulation of symbolic links
("aliases"). It's not the filesystem of Windows95 which handles them,
but only the Explorer. For a test, create a shortcut to any textfile,
and try to open this shortcut from inside notepad (not via "SendTo" or
any other Explorer-involved means). Or, even better exampe: Create a
shortcut to a folder, and then try to access a file inside the folder
using the shortcut's path, again from within an application.

As you will see, that doesn't work. The philosophy of symbolic links is
a lot different from what the Windows shortcuts represent, so there's no
way to use them as symbolic links inside MagiC PC.

> It seems to be impossible to get to the program manager as the key

Read the manual ... For this very combination, press the key left of '1'
instead of Escape. So, on a U.S.-keyboard, that means you need to press
Ctrl-Alt-~ to open the program manager.

> Sound support seems to be limited to the odd beep. Even programs which

I don't know whether MagiC PC tries to fully emulate the Yamaha chip.
But MagiC PC 6 (at least available in Germany) has DMA-sound emulation.

Ciao

It's the Dancing Baby but dressed in terminator style shades and with a gun.
It's about 2.5Mb. Can't remember the exact url because I downloaded it at
work. But all I did was type in 'terminator, baby' into Yahoo, and it was
one of the first sites listed.

Kev,

just forget about it.... this guy is The Client for TOS 1.00, nothing else. Doesn't WANT to see that configuring things could mean a little more than doubleclicking a file and getting a TOS screen with garbage or readable txt, but he sticks with TOS being the best because it did just that and nothing else. Well, LET him! These might be the suckers that complain about apps using the right mouse button, because on TOS 1.0 it doesn't do a thing and they want it that way.

I could put all this different: had we got stuck wih TOS 1.0, the Atari hadn't been MY computer for a long time...

But Mr. A. Mad thinks, so we should praise him for that.

Is it too much to ask that there is an internal displayer in a modern replacement desktop? It's such a simple concept to grasp. Neodesk & Geneva do everything I want. Maybe if Thing was to utilise all the good points about Neodesk as well then that would be one super replacement desktop to use. But as it is, I'm afraid that I'm sticking with Neodesk for now.

Hi

I've just got my hands on a Pioneer DRM-624X a 6 x CD-ROM changer. It's a SCSI device and uses LUN numbers from 0-6. E.G.. Drive ID=5 lun=0, drive ID=5 lun=1 etc...

How do I get Extendos (v2.4) to enable me to use this drive fully; or is there another package for the Atari ST that would do the job?

Any help will be more than appreciated.

Why not replace it with a PC drive. Much cheaper and easier to find.

Subject: Okami Thanks/Binary Posting Request
Keywords: Okami Icon
Thanks to all who assisted with my recent Okami setup and
configuration.

As a way of saying thanks to the group, I have made a couple of colour
icons for Okami which I would like to share. The resulting .RSC file,
once it is compressed and UUEncoded is 1217 bytes long - scarcely
longer than this message.

Would anyone object to my posting this file?

In the word DESKTOP replacement there is the word DESKTOP.
which THING does exactly this. it is a desktop. Not a viewer desktop.
nor a desktop + a viewer.
2) if you add a viewer in THING. it means that it would take even more
space than it is already.
3) it would have to be a very good viewer, and sorry but nothing really
beat a real viewer, that was designed ONLY to be a viewer.
Can the neodesk viewer see all the long filename? file such as:
".my log in ppprc" can it?
can this neodesk viewer display colors/font as you want them?
Is it a fast viewer? can you cut and paste?
Basically, does it stand as being a GOOD viewer?
Let the coder do a GOOD real viewer. then let THING use it. It is all for
the best.
"Textview" is the number one choice and I doubt any other text viewer can
be as good, as small, as nice as "textview"

The old concept of ALL intergrated into one might be good for some people.
But to be honest, modularity is what's really powerful, flexible.
All that because you didn't want to set * to a real text viewer.
I just say: Weird.

I telephoned them on 01525-718181. They also are on the Internet
although it is mostly Amiga stuff.

They tell me that they will not be handling Papyrus 6 but that an
English version is being prepared.

I downloaded the demo of Papyrus 6 from ROM logicware's site. It
handles HTM files and is an *excellent* way of converting htm files
to ASCII or RTF or whatever. It doesn't print but it does save RTF
at least. (I didn't try the other formats.) I see from their website
that they are up to version 7. There seems to be a demo of that but
only for pccc.

Should have guessed, I suppose, given the nature of Win95: ie lots of
surface gloss and everything held to gether with string and rubber bands in
the background.

> > It seems to be impossible to get to the program manager as the key

Well, I finally found it in the manual, but as the main section on the
program manager consistently refers to Ctrl-Alt-Esc all the way though, I
think I can be forgiven for not spotting it first time, especially as the
manual has no index!

> > Sound support seems to be limited to the odd beep. Even programs which
> > don't need DMA sound don't seem to produce anything so far, which I had
> > thought would be OK, not that it's a major problem.
>

The manual rather implies it does, but I haven't systematically tested it.
All I've managed to get out of it so far has been the keyboard click (until
I turned it off, naturally) and the warning beep.

> But MagiC PC 6 (at least available in Germany) has DMA-sound emulation.

Just had a quick look at System Solutions' web site and there's no mention
of MPC, let alone version 6, that I could find quickly. The front page
mentions NVDI5 as being available, though, so I guess they are updating it
occasionally. Hopefully MPC6 (English) is on its way.

ASH's site just seems to point at SysSol and Toad for English language
versions. As Toad have been out of the Atari market for around 2 years,
you'd think they would have noticed that their North American distributor

was no longer operational...

4070. ST/Falcon hard drive size limit?

Newsgroup: comp.sys.atari.st
Date: 1998-12-06 00:00:00 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <366B4094.AF@primenet.com>
Source record: 88732

I am just curious, how big a drive can I use on a Falcon (via the SCSI port), and also on an ST with TOS 1.02, and on an STe with TOS 2.06? (in a Supra host adaptor/box) If I use a 1 gig drive on my Falcon, how many partitions will I have to break it into, with the standard TOS? Will a SCSI 2 device run on a Falcon? SCSI 3? I am totally confused here, and afraid to buy a drive bigger than 170 meg for fear I will waste space, have too many partitions, or it won't even run because it's too new a type of SCSI. Thanks a million if you can clear this all up. -Satcom2

Funniest reason to use LAN instead of S2 that I ever heard of. There are
lots of tools around for changing the settings. STinG's Serial Setter
should do it too.

> Besides, Serial2 doesn't provide the 230400 baud rate

Sure does. S2 and LAN share the same controller channel, so every speed
that's available for either is available for the other.

> we prefer for
> 56K modems or ISDN adapters

Virtually never the actual transfer speed comes even close to 230 kbps.
It would require the 4x compression ratio, which is achievable only for
very special kind of data. Seldomly enough you will be able to tell the
difference to using 115 kbps. It's like buying a hovercraft instead of
a car because one day you might want to cross a river which hasn't got
a bridge. ;-)

With 230 kbps you also need to pay attention to the cable. Many of the
available cheap cables won't work reliably anymore.

There might be other components which could have changed the settings.
HSMODEM for instance can be configured to come up with either setting as
default.

> HSModem/Serial CPX/Nova card and connected to Serial 2, Serial CPX
> reports that 230400 are available for both Serial 2 and lan

Which is correct.

> the set-up for HS Modem. If I enable 230400, my 33.6 modem does not
> see it as a valid rate, so I have to assume that the port speed of
> Serial 2 has been altered.

Wrong conclusion. Few modems support 230400 kbps, for the simple reason
that PCs do not support this speed on their standard serial ports. With
a 33k6 modem I had found it additionally unlikely because there is no
way that such a modem would need more than 115 kbps. So go to 115 kbps
which also potentially saves you trouble originating from your cables.

Cheers Peter

Band In a Box Comes Close...
It doesn't "work out the harmony" for you automaticly, but it will build arrangements based on the chords you type in. It uses "style" templates, many come with the package, and you can build your own. The last version I saw composes for Percussion, Piano (or guitar if you choose that sound on your midi instrument and enter your chords in a proper inversion for that instrument), and a Bass line.

Example, you'd pick a style, Medium Swing for instance. Then you'd pick a tempo, and a key. Enter the chords, such as Cmaj,Gma7,Cmaj,etc, click in your road maps (repeats, chorus, etc), and mark sections you'd like an abrupt change in style (such as a walking bass line the second time thru for some variety). It builds this for you, can play it over your midi device(s), and can save it as a MIDI file if youd like to load it in your sequencer and change it up a bit.

Next, if you can still find a copy out there somewhere, there was the KCS Omega Level II package that included a Math based programmable variation genorator. A very powerful, and complex piece of software where you could enter limits, and let the computer generate music for you based on said parameters. If one studied the program very intesnly, and practiced alot, there's no telling what all it could do!

Brian

Well, Hello then. I'm not gonna even try convincing you of Thing's use,
but generally speaking. So you want doubleclick *a* file and have it
displayed... Right? Then what you think mite happen when you doubleclick a
ZIP, LZH, JPG, whatever file? Old TOS would display uncontrolable garbage.
Even if a file was printable, TOS didn't make much from it.

What I mean is, OK, it's taking a bit of time and effort to set it up, but
I can click on about every file on my desktop and Thing does what it's
supposed to do: send the ZIP to ST-ZIP and have it unpacked, send the JPG
to Graftool for display, send the TXT to either QED or That's Write (my
choice), displays the INF in QED, etc. etc. etc. Don't need a doubleclick,
one singleclick is good enough (another Thing goodie). Come to think of
it, if you'd install Graftool as the main app for any file, at least it
displays ZIP's, LZH's, TXT's etc. decently. I'm just glad Thing doesn't
decide what to do with the double-clicked file, it's all MY choice. Takes
5 minutes for configuring, that's it.
Now whether you do that with Thing, or Jinnee, Neodesk, whatever, doesn't
matter at all. My choice is Thing, and it's been that since v. 0.26.
Sometimes I want to just look at a TXT file. Any viewer would be good
enough. Next time I wanna edit it. Graftool would be a bad choice...
Is the light shining already?

I'm trying to remember the name of an Atari ST midi controller application --it allows you to map keys to events, i.e. trigerring a midi file from your synth or mapping different zones to different channels. It wasn't PRO Midi Player, nor was it a sequencer software package like Cubase.

Does anybody know the website for this application? I've been looking for weeks now.

michel

There is no size limit at all. Note, however, that for the ST/STE an ICD compatible host adapter is required if you want to connect a driver larger than 1 GByte. Also note that the maximum partition size depends on the TOS version. Even the oldest TOS supports 256 MByte per partition. On the Falcon you can have TOS compatible partitions of up to 1 GByte. With FreeMiNT 1.15 you can create an F32 file system and then you have virtually no limit at all.

> SCSI 2 device run on a Falcon? SCSI 3? I am totally confused here, and

Yes, SCSI-2 is fine for all Ataris.

> have too many partitions, or it won't even run because it's too new a
> type of SCSI. Thanks a million if you can clear this all up. -Satcom2

You can use any SCSI-2 peripheral.

Only as a default at the beginning like TOS

> ZIP, LZH, JPG, whatever file? Old TOS would display uncontrolable

I know that, I have those types of files already set up to load
applications.
You still don't seem to get my point that everything should be tried to be
displayed up until the point when you set an app for it. You do have 3
options when you DC the files, print, view, cancel. What more do you need?
It's better than getting a message suddenly popping up saying something
like 'sorry, you've not set up an application for that'

> Is the light shining already?

Not at your end it seems.

AM.

I think therefore I AM.

> 2) if you add a viewer in THING. it means that it would take even more
> space than it is already.

Right then. What's wrong with "referring back to TOS" for the viewer then?
If it's in "plain old TOS" then it must still be there mustn't it?

> 3) it would have to be a very good viewer, and sorry but nothing really
> beat a real viewer, that was designed ONLY to be a viewer.

Not really, just something to show the file. I don't want to wait for an
app to load, and then load the document, just displaying it straight onto
screen is fine.

> Can the neodesk viewer see all the long filename? file such as:
> ".my log in ppprc" can it?

I don't know, I have never used long file names

> can this neodesk viewer display colors/font as you want them?

Colour? Why would you want lots of colour in a simple ASCII document? As
for fonts, system font is fine for me as I don't like all this fancy shit.

> Is it a fast viewer? can you cut and paste?

Yes it's fast, and I've never needed to C&P so I can't tell you that
either.

> Basically, does it stand as being a GOOD viewer?

It does from my point of view because I can use it to "VIEW FILES"

> Let the coder do a GOOD real viewer. then let THING use it. It is all for
> the best.

It doesn't have to be good to do it's job.

> "Textview" is the number one choice and I doubt any other text viewer can
> be as good, as small, as nice as "textview"

I don't believe I've ever used it

> The old concept of ALL intergrated into one might be good for some

If it's there doing nothing in the ROM, you might as well utilise it.

> All that because you didn't want to set * to a real text viewer.
> I just say: Weird.

The point is, I don't want to use an external viewer, I just need something simple to show the files, there's nothing too difficult to understand about that is there?

AM.

I think therefore I AM.

^^^^^^^^^^^^^^^^^^^^

Eerrmm, ??? Nothing? Everybody agrees? Then why Thomas, did you put all
the other options into Thing??? We don't need them???

>It's better than getting a message suddenly popping up saying something
>like 'sorry, you've not set up an application for that'
>
>> Is the light shining already?
>
>Not at your end it seems.
>
OK, I'm gonna flick the switch one more time: then install Graftool for
any file... Has print options too, so what else you want?
BTW: Thing itself has no built-in app for that, Katherine already
explained why. Then again, she may have used a blacklite too...

May the moon be shinin' brightly for many days and nites to come :-)

Ok, okay, so I took the drive back to the store...they tested it...it
seemed to be broken....and gave me a new one.
Now it works fine as a 2nd IDE master. I tested it and it seems to
work quite well as a slave of my harddisk also, BTW.

Such simple utils do exist. Download from any FTP out there. The difference
from old TOS is that you now actually have a choice if you want to use a
sofisticated editor, or just -a viewer. Let thing be a desktop only.

> > can this neodesk viewer display colors/font as you want them?

> It doesn't have to be good to do it's job.

Well, I certainly don't agree on that one. Even if things are simple, they can
still be good. Can't they?

> The point is, I don't want to use an external viewer, I just need something
> simple to show the files, there's nothing too difficult to understand about
> that is there?

A viewer is a viewer whether it is internal or external. If you hadn't had a
harddrive I would agree, but now the reason to be so stubborn about an
internal viewer sounds a bit strange to me. I can't understand you put so
much time in discussing how irritating it is to spend 5 minutes to setup
THING properly. Can you REALLY say that you're holding on to neodesk for this
reason only? Come on! :)

The Atari Warehouse is having a Christmas Sale. All prices have been reduced, and I am offering a 10% discount on orders over $50 (but then again, I am always open to reasonable offers !!). All software is new, complete, and in it's original unopened packaging.

Please check my current stock list at:

http://toronto.planeteer.com/~rsmith/atari.htm

Thanks,

Richard.

>
No, just because the simple TOS text viewer is not good.
Use what's good if possible. and remove the crappy things.
What's crappy in it?
1) it doesn't kow how to display LF text files. With your "oh so good,
simple" TOS viewer, you'll just see a bunch of characters on the right
side of the screen. Can't read nothing.
TOS viewer DOES NOT know about LF files.
This is 1 big thing already.
2) in a multitasking environment, well, heheh it does NOT multitask :)
It takes the whole screen!
which is not really handy, let's say you have some info that you want to
reuse, like some addresses, or whatever. You need to cut and paste, but of
course if you don't need all that, well what do you do with your
multitasking?

> Not really, just something to show the file. I don't want to wait for an
> app to load, and then load the document, just displaying it straight onto

That's Cubase Audio 1.1, I beleive, not Cubase or Cubase Score. Therefore you would need a key for Cubase Audio. The keys were different with nearly every version, making the whole "free upgrad" policy a big mess.

>That is boring. Anyway, I have removed Thing so it's useless. You

Nearly every program needs a bit of setting up, Thing is well documented so setting it up is easy. There's hundreds, probably thousands, of Thing users out here that are wondering what the heck you're going on about! ;-)

>shouldn't need to have to do this in the first place.

I see your point when comparing to TOS, but Thing is so much more flexible, especially if you use STGUIDE for viewing text files. You can also print whole pages or just blocks from text files - you can't really do that with TOS's SHOW PRINT CANCEL function.

It takes minutes to get Thing configured to handle almost everything. I just click on a file and can unzip, decode, view, print, edit etc etc whatever it is automatically with just a minimum of input from me!

Don't knock Thing, it's one of the best 'things' around ATM!

Kind regards

Mike Kerslake

Hi again Kev,

well, agreed. Thing nr. 1, Jinnee nr. 2 (provided it has an english RSC). Years ago I got Neodesk-3 sitting on a HD I bought from someone else, I simply deleted everything after 3 days. Back to Thing. I don't like Magxdesk and plain ole' TOS is bull (even my 3.06). Don't know about Geneva but it has its lovers too.

What I would like to see added to Thing is configurable springfolders (Thomas is working on that one) and color support for 8 bit. But it's nearly perfect as it is now :-). Perfect combo with MagiC and a perfect AV-server. Keep it going Thomas!

Joakim,

really very short: it starts up OK, then every menu item gives me a box filled with the upper left corner of my desktop. Only the HELP works OK. Tried to "quit" from Multistrip (since the Quit function in the menu was greyed out, probably because the first thing I clicked was the "about" item and I couldn't get that one from the screen) didn't work, next I tried "terminate" and it disappeared. This is with MagiC 5.01/NVDI 4.12/Thing 1.27 on my card (24bit mode).

Hope this helps...

Bram, I use Interface. Can add 256 color versions if I want to, it adds
mono versions too. Real nice. I understand RSC-Master is nice too.
I use Interface for translating RSC files too, tho' on old files it
sometimes messes them up. My Thing ICN file is about 150 K now, and it's
growing steadily :-) Gotta look into Hallvards icons soon...

Good evening

I use "replay profeesional" 8 bit sampler cartridge. It has certain limits but I
hope that's a "characteristic" not an "inferior sound"!

Have a look for "stereo Master" or "Mastersound" or "Replay Professional" or "replay 16" (16 - bit quality), and make sure you get the software also. I use the software for Replay Professional to make my ST a sampler but it crashes sometimes. It might be better (esp. for live work) to buy 2nd hand AKAI unit. Definitely easier to find!

Nelson

Hmmm - I've just downloaded it and the archive contains 4 files -
nemesis.cpx is one of them...

Did you go to the ST/Falcon section on the web site and download from
there?

I was referring directly to the ASCII files if you was paying any
attention.

> OK, I'm gonna flick the switch one more time: then install Graftool for
> any file... Has print options too, so what else you want?

I don't want to have to install a viewer, seeing as it was the absolute
basic thing that came on TOS, it shouldn't need to be installed. How
frustrating is it to find that you don't have a viewer to use??

> BTW: Thing itself has no built-in app for that, Katherine already
> explained why. Then again, she may have used a blacklite too...

> lacking on some of the features of other shells and even orignal tos

Nothing is perfect. I would not say Geneva & Neodesk was perfect, but they
do all I want and more, so I'm sticking with them on my STe.

> the overall view i'd say is a big plus for thing

I suppose there's still a lot of hope for it as far as replacement desktops
go. And the price is fairly reasonable too.

AM.

I think therefore I AM.

> multitasking?

1. I do not use C&P, in fact, I have only ever used it whilst doing some homework using 1st Word.
2. Most of the stuff I look at is just the basic instructions of a program, if the program doesn't multitask then that is your argument blown for that one :)

> no it is not at all, as explained above.

It is perfectly acceptable for my needs.

Thankyou, and goodnight.

> sofisticated editor, or just -a viewer. Let thing be a desktop only.

Could be something supplied with Thing, like Geneva has an Extras disk,
which I don't think I've looked at :)
I still think it would be nice.

> Maybe you dont, but a lot of people do... :)

I don't see the point when it comes to just ASCII. Documents and stuff
yeh, but plain old ASCII?

> I think that most people find cut and paste is something hard to manage
> without.

Not me, like I said in the other post, I have rarely used C&P to any
serious extent.

> > It doesn't have to be good to do it's job.
> Well, I certainly don't agree on that one. Even if things are simple, >
they can still be good. Can't they?

I believe that is what I just said, but with different words.

> THING properly. Can you REALLY say that you're holding on to neodesk for
> this reason only? Come on! :)

There's more things I don't like about Thing, but I suppose one of the main
reasons is that Neodesk runs so nicely with Geneva that it's as if they
aren't 2 different programs.

AM.

I think therefore I AM.

Not here it hasn't. If you recall I mentioned this problem in mid May, at
the same time as I reported the CC: bug. You replied that POPWatch didn't
support nicknames as NEWSie doesn't put a 'To: ' line in the header and
POPWatch doesn't parse the 'outbox.mbx' file to find out who the message
was being sent to.

BTW, If you care to look it up, you're reply was dated Wed, 13 May 98 and

Well Pacifist is far from being a TT. The speed of pacifist could be at
fault I suppose, but the game itself is prolly still only the first version
he knocked out, as he managed to get some routines done to increase speed
by about 30%

> Looks like Hellgate has potential, but Doom it ain't...

It looks more Doom than what Substation did though, you have to admit that.

Should be great when it's finished though.

I agree that it may be troublesome having to install a viewer for text file.
When I first tested out Thing, it was very bad --> no application was
installed. I cannot even read the text files. But it took SOME minutes to
install it as I need to go through the menus. And I had to wait for that
Editor to load.

Unlike the shell for MagiC (MagXdesk or something like that, but I know you
all know which product I am talking about), the text viewer is installed for
you. This makes it seems easier to start using.

Well, everyone is entitled to their own views.

I find that Thing & Jinnee both to be slow restarting after a multitask
unfriendly program exits. Yes, I have tried using that "do not unload shell"
feature, but they still seems slow. Also tried disable reread/update drive,
still not much improvement. (Ease is slowest) BTW, I set donot multitask
flag for these unfriendly programs, which unfortunately is one of th programs
I frequently use.

When I am not using multitasking, I am using good-old GEM Shell, with WinX.
Of course I use a fast decent viewer for text files which can filter LF->CRLF
& HEX display for those rubbish display & can print as well, configure for
. in the INF file.

There is a new version Papyrus (7.02) that is suppose to be available
(English version) about Christmas. Check out the R.O.M home page.

Yep, I've sadly realized that. I setup the audio device, then setup
mpg123, but even with -4 downsampling and mono, I only got about .5 sec
of sound every 6-8 seconds on my Nemesized Falcon 030 when I tried to
play "W95SUCKS.MP3"... Pity too, I really wanted to hear it. ;-)

So whats everyone else's results? I'd like to know how TT-030, Milan,
Hades, and Centurbo2 equipped Falcon owners are doing with this. Thanks!

As I don't have an FPU in my ct2, I can't test it at all. Doesn't even
run, it says illegal bus error or something like that, (just like any
other FPU prog say when running without a fpu).
too bad

Hey I have been getting more and more E-mail in HTML format. I can read it using the IBM, but I would rather use my Atari. Is there a email program that can display the HTML format, without d/loading it and than reading it in CAB. Currently I am using Newsie 0.88

Any suggestions is great.

Thanks -

Yes, the fonts for laser printers had the extender L30. There are loads
around, the FaST Club in the UK are probably the best bet.

As for the printer driver that was a seperate prog IIRC.

Yes. It's a piece of cake once you have registered. To do this you need a browser which supports SSL so you either have to use a MiNT internet config. or 'borrow' some time on a PC.

Does anyone know where I can get hold of a Data sheet for the HD6301
keyboard chip in the ST.
I have a pin out from a schematic diagram, what I am really interested in
the power supply requirments and don't blindly say it's 5 volts, I know
thats what it says it get on the schematic and is also what it gets in real
life however it may run on less than that and I also need to know the
current consumption.

Thanks,
Stephen Moss.

I have the key for Cubase Audio. I should have stated that; and actually it is Cubase Audio v1.0.2 that I have (not v1.0.1) and it works (at least the MIDI part).

Hi Misha

Thanks for your help, of which is very appreciated.

The usual thing happened, (1) I missed a page in the manual which had a diagram (no text, just a diagram) that told me to place the CD's in the caddy reading surface up!

And (2) I sussed ExtenDOS out. To add additional LUN numbers use a period; e.g. 5.0 (LUN 0), 5.1 (LUN 1) etc.... This isn't mentioned in the manual.

Now all I have to do is find a way around the 26 device (alphabet) thing and a way that will cut down on the boot up time, as ExtenDOS seems to check every CD slot!

>cpu but there are faster newer designs to be implemented.

Correct me if I'm wrong, but I thought a 680x0 could perform a task in
one clock cycle that takes an 80x86 four clock cycles, which means
we'd only need a 120 MHz machine to equal the power of a 450 MHz
Pentium II.

This 4-to-1 ratio is primarily due to:
1) Inefficient microcode by Intel that must remain compatible with the
original 8086 (which was basically a super-advanced calculator
compared to the 68000's much-ballyhooed "orthogonal"
instruction set), and
2) Inefficient windowing operating system by Microsoft that DEMANDS
higher speeds just to display a line of text on the screen.
Remember that GEM was designed to run efficiently on a 6.77
Megahertz IBM-PC while Microsoft's version 1.0 was so dead
slow that nobody took it seriously.

There's a lot more to system performance than clock speed.
That's why Intel finally integrated the match coprocessor directly
into the processor chip and developed the "predictive branching"
work-around in which the address unit guesses whether a
conditional branch will execute or not and fetches the result
before the CPU processes the instruction. (I don't know whether
the "register scoring" technique used in the 80960KB has been
implemented in the Pentium series or not, but if not they'd better
do it quickly!)

That's why Microsoft started suddenly making noise about
"smaller, faster code" somewhere between 3.11 and 98.

That's also why a well--programmed Falcon (with the DSP
coprocessor as well as the optional math processor) is much
more powerful than one would suspect.

Take pride in your machine ... is still technologically ahead, even
with a slow clock speed.

Dear Gang:

I'm new to the site, so forgive my protocol.

I inherited an Atari 1040 ST with ALL the bells
and buzzes for its time.

If anyone's interested, please feel free to E-Mail
directly to me, since I don't have the opportunity to
come to these sites too often.

Trust me, I'll make a good deal. Thanks!

Sincerely:

Trace

>The 680x0 family has been around for may years and it is an exelent
>cpu but there are faster newer designs to be implemented. (multiple RISC?)

It's easy to implement RISC coding techniques on a stock 68000 --
just don't use complicated instructions like "decrement, branch on
nonzero" in your assembly coding. Although RISC is supposed to
give a speed increase (and it does, usually), it's real purpose is to
jettison excess silicon so the die can be made smaller and cheaper.
A computer based on a $5.00 CPU (does Zilog still make the Z-80?
how much does a 68000 cost these days, anyway?) will be much
cheaper than a computer based on a $200.00 CPU, in theory at
least (and ignoring related issues such as volume of sales).

I'd like to see Motorola refurbish the 68000 and 68030 processors,
adding the necessary hardware to allow ... say ... a master 68030
to act as dispatcher and scheduler for a farm of *8* (or 12, or 16
or however many) 68000's, each with some dedicated local memory
(a megabyte each should work) and DMA access to main memory.
Add a load-sharing manager to GEM/MiNT/MagiC/Geneva to make
efficient use of multiple processors and coprocessors and it would
take much more than a 450 MHz Pentium II to keep up with a modestly
priced all-16 MHz system with a 32-bit bus.

Oh, well, I can dream, I suppose.

Which Email address did you send your query to? FWIW, we have been very
busy recently as we attended 2 shows in London (DMW and CDT). So we r a
bit behind on our Email.

If you wish you can Email me directly on the Email address below.

I apologize for the time taken to reply...

Hello!

Many years ago I was enjoying a game on my Atari XL/XE computer ,
BALLBLAZER.
This was a furious two players game. A few years later, when I got my
first Atari ST , I looked to find the same game on Atari ST. I know
that there was ST version of BallBlazer but the nam was a different.
Do someone remember the exact nam of this game on ST computer?
If so I would appreciate greatly any information about this game and
maybe where I could find it on the net.

Thank's a lot

Rolland

>
> Hope this helps...

I think I know what has caused the problem. The windows contents are stored in memory, to enable quick redraws on old ATARIS. (Like mine ;))
This should affect all Operating System with lots of colours, not just MagiC.

I have suspected that the routines will demand a LOT of memory if the number of bitplanes is to big. The thing that happens is that hEARCoach can't find enough memory to allocate for the windows, and the program is not prepared for this. The reason I haven't discovered this problem is that my old STe is run with 640x400x2.

I'll will do my very best to find a solution to this.

Runs on the emulator (pacifist) OK, although jerky on my P166MMX. Is that normal with that game or is it just the emulator speed?. Demos seem to work just fine so I'm curious.

Looks like Hellgate has potential, but Doom it ain't...

Hi

Ballblazer was also the same game as Trailblazer on the 8-bits, and
Trailblazer was the same games on the ST.

I hope this helps.

4179. Just a little more Okami help please...

Newsgroup: comp.sys.atari.st
Date: 1998-12-08 00:00:00 UTC
From: lockwood@calcna.ab.ca
Message-ID: <74jsso$gcs@ds2.acs.ucalgary.ca>
Source record: 88629

Well, I've managed to get it going - mostly. Just one thing between me and total success and that is managing my mail folders.

I subscribe to a couple of maillists, and I would like these to show up in their own folder under Mail. Since I use PopWatch, I can control the junk mail I receive, but there are a few items that come in that I am interested in, that are not addressed to me personally. When Popwatch sees something like this, it downloads it and writes a text file named after whomever the original mail was addressed to (NOS method).

I've looked at FOLDS.INF, I've created an ALIAS file, I've spattered MAILFOLD.INF files all over creation, and I still have not gotten what I'm after:
1) a mail folder named lockwood for my personal mail
2) and 3) a folder each for the two maillists I receive
4) a folder named "other" for the other mails I wish to receive that are not addressed to me personally.

Any and all suggestions are most welcome.

Read the documentation. Each LUN becomes one drive letter, so you would have
D:, E:, F:, G:, H:, and I:. It's a simple configuration ASCII file.

I think I grasp the point AtariMad was making.

In Mac System 7, I used to get annoyed whenever the desktop would tell me that it couldn't find the program that created the file. In OS 8, it now gives me the opportunity to select the application.

If I were new to Thing, I'd want the desktop configurable so that I could use any external viewer. However, if Thing encountered a file that was not of an already configured type, I'd expect it to display the file as best as it could. Tossing error messages at the user is infuriating.

For the record, I have no configuring done under Geneva, since I prefer the "drop the file onto the program icon on the desktop" mode of operation. This is partly due to the fact that I occasionally WANT to look at my files as ASCII. Often I can figure out what they are within a second or so even if they are mangled, and the process is far faster than waiting for programs to load.

Well, I think it's not hard to configure your external viewer for "*".
It will then be only used for files which do not match a more precise
filemask, e.g. "*.rsc", thus being the default for unknown filetypes.

Ciao

Thomas

I have just now been trying out my CAB/STING/NEWSIE wiht Geneva and
no crashing problems. I did notice the on the NEWS deleteing if I set
the threads with the plus and minus only and read them in order everything
gets deleted propely. I noticed that a problem arises when you delete
a file from a thread you keep the empty file name and if you try to
delete this will give you the phantom drive message to reboot.

Hmm. That'll be difficult. I binned Oasis2 ages ago now. If you've still got
the reply can you mail it to me.

I'm confused, because POPwatch does handle Nicknames (always has). I think
maybe your idea of handling nicknames, differs from mine. Probably just
terminology. It's been a while, and I'm not really to familiar with the ins
and outs of the NEWSie code (as I don't use it). So maybe I'm wrong.

Hi Steve,

I don't know about Extendos, but I've looked at a package called Spin!
(ready for when I get a CD-ROM drive <g>). From its docs:

Status: Giftware. That means: (a) Free for new users and people who
have contributed, (b) All others should take another look
at the license conditions in SPIN.TXT.
[cut]
SPIN_SD.BOS now also supports LUNs other than zero. This
can be useful for operation with phase-change drives
and CD-changers.

I could be wrong on this, but IIRC this doesn't work correctly with STiK or
STinG (might work OK with Iconnect: never tried it myself): you need to
enter the proxy information in the STiK/STinG config files. Worth a try at
least: it worked for me with STinG/CAB 2.5.

Martin,

as Katherine also suggested, this was by doubleclicking the file. I only recently (!) discovered this feature, thus it never happened before.

Good thing to know, anyway. Just have been fetching the Debian Linux installation package (good Lawd, D/L the 6.5 Mb .tgz file took me 2:45 hours, long live the Internet!) and thank God the .tgz app isn't properly configured so I was back to aFTP in half a second. Next time I'm gonna d&d the file again or use the menu entry.

4204. Q: [CCP: timeout sending Config-Requests] meaning?

Newsgroup: comp.sys.atari.st
Date: 1998-12-09 00:00:00 UTC
From: tos4ever@ping.be
Message-ID: <366ee3d03587110@ping.be>
Source record: 88499

Hello,

since some time I've severe troubles with my ISP. Most of the time I can
login fine but the data transfer rate is mostly very low. Sometimes I only
get 350 cps download speed (mail/usenet). Normally it should be around
3200 cps.

My ppp-log file show me this:

Dec 9 18:08:20 hades pppd[74]: CCP: timeout sending Config-Requests

Before I talked to my ISP I'd like to know what the meaning is of that
line.

BTW: I'm using MiNT/MiNTnet (with AFAIK the latest drivers) for my
Internet connection

It can (probably) be done by the DSP, there is a project going on
right now. There are other options though, e.g. a cheap
hardware-decoder ($50-$100) could play mp3's in the background even on
standard ST's. I'm looking into this ATM, I'll know more in a month or
so.

4219. Mac to Atari Transfers (via modem)?

Newsgroup: comp.sys.atari.st
Date: 1998-12-09 00:00:00 UTC
From: Mark Simpson <marksimp@integrityonline7.com>
Message-ID: <366F34B9.676268C4@integrityonline7.com>
Source record: 88514

Hi,

It appears that it will take a while to get HD Driver upgraded, so I'm looking into other ways to pass data back and forth between my machines in the interim.

I am wondering what is needed to network my PowerMac and Falcon via modems. I have a 28.8k modem on the falcon and a 56k modem on the Mac (both supras). I would be using Freeze Dried Term Program on the Falcon. What would I use on the Mac (hopefully shareware), and what kind of transfer speeds could I expect? Or is there an inexpensive way to actually network the two machines?

Thanks,
Mark Simpson

You should put only one line in the alias file for POPwatch for what
you want:

* lockwood

Then play with the mailfold.inf file to sort the mails in accordance to
the senders.

Yes, and you point being?

I said I had removed Thing, so if I do not have it on my system it cannot be used, thus it is useless.

I do wish people would read what I say not what they think I say.

AM.

I think therefore I AM.

>1) a mail folder named lockwood for my personal mail
>2) and 3) a folder each for the two maillists I receive
>4) a folder named "other" for the other mails I wish to receive that
> are not addressed to me personally.

Hi Frank,

First off, create the following ALIAS file in POPwatch's directory:

* postmaster
lockwood lockwood
mail-list1 lockwood
mail-list2 lockwood

and substitute e.g., magic_os for mail-list1 and similarly for
mail-list2 (whatever address it comes in as).

Then, create MAILFOLD.INF inside _O_MAIL\LOCKWOOD\ in your articles
dir:

MagiC magic_os@onelist.com
List2 mail-list2@some.domain

again substituting particulars for your actual mailing lists.

You'll then get personal mail into Okami in Mail.lockwood , list mail
into e.g., Mail.lockwood.MagiC . (IOW, POPwatch combines personal and
list mail into lockwood.txt, then Okami separates it out again <g>.)
And any spam you let past POPwatch will turn up in Mail.postmaster :-)

BTW, FOLDS.INF is not relevant here ;-)

>Any and all suggestions are most welcome.

HTH :-)

Cheerio,
Misha

P.S. Thanks for the icon :-)

Yes, there seem to be a few bugs in the program which will no doubt be
ironed out before it's released officially. No doubt that a bit of
optimizing will be done in due process.

> > Looks like Hellgate has potential, but Doom it ain't...

I haven't been able to get Newsie to run on my TT with Geneva without
problems since Newsie 86. I have even tried the beta of v.94 which is
better than v.92, but still isn't completely compatible with my Geneva
setup. You and Frank Lawrence are the only other Geneva users with a TT
that I have found so far.

From: flipflap@coastalnet.com
Message-ID: <3XIb2.3$mS3.94@news13.ispnews.com>
Source record: 88566

My TT running Geneva has a problem with Newsie that started with Newsie88 and is still there with 90 and 92. I usually read newsgroup messages offline. The first time in a session that I delete a message I get the dialog "TOS is attempting to access an invalid drive". I hit return and on the next message I delete it will do the same thing, unless I have a floppy disk in the drive. If there is a disk in the drive, I only get the TOS error message once, on the first message I delete.

This is a minor annoyance and I can live with it. The big problem is, anytime I have deleted a message and then quit Newsie, the next time I use Geneva's Task Manager to start a program I get a major crash. As soon as I select "Open" in the Task Manager's File dropdown I get "fatal error in Geneva: run_acc did not terminate". The computer hangs up and can't be rebooted from the keyboard, only by shutting off the power.

Could this spurious accessing of the floppy drive be caused by SCSI termination? I replaced the original TT drive with a Quantum 740 mb Lightning a long time ago and have never had any other drive problem. I'm grasping at straws here trying to find the reason Newsie screws up on my system.

Hello All:

Just saw an interesting Post on the Cubase Newsgrp. I usually go there to see all the problems people are having with Cubase VST and IT IS a sorry state! The post was called SOLVE ALL PC CUBASE PROBLEMS. He proposed getting an Atari with Cubase and sync it with SAMPLITUDE on a PC . This sounds interesting..using the Atari with it's superior Midi Timing and using the PC for Digital Audio . Never heard of SAMPLITUDE, but I am not a PC musician..might be worth looking into. I have a 486 my wife got for me (for $20.00 at an Auction!) That might be good enough. I am using a TT030 to run Cubase. This might be a solution for us that do not have Falcons , but have a PC sitting around doing noth'in but MS Office stuff! Comments?

Mirko:

It depends on what Data you have. Are they Text Files? They might be
specific to Atari applications. If you just want to be able to read the
files on your PC, Get some 720K PC formatted discs. Copy your files
from the atari, and simply load the discs(s) into your PC and read
them with Word or whatever.
Hope this helps

4240. Gemulator Classic

Newsgroup: comp.sys.atari.st
Date: 1998-12-09 00:00:00 UTC
From: Ian Numan <iannuman@netspace.net.au>
Message-ID: <366E3888.FDD3325C@netspace.net.au>
Source record: 88575

I just downloaded Gemulator Classic 3.8 (DOS version of Gemulator),
and am using it with a TOS image file (2.06 UK).

I've got Gemulator Classic to run ok, but when I double click on
any text file to read it, I get an error dialog box saying:

"VIEW-II.TOS not found"

Is this file needed to read text files?
Where can I download this file?

Any help would be grateful.

Cheers
Ian

You can use either floppies (720K DD DOS formatted disks), a serial
null-modem cable with ghostlink (slow but convenient) or a custom made
parallel port cable with parcp (fast but fiddly).

Check out the Quick FAQ for details:

MO> First off, create the following ALIAS file in POPwatch's directory:
MO>
MO> * postmaster
MO> lockwood lockwood
MO> mail-list1 lockwood
MO> mail-list2 lockwood

Done. [substituted my maillist names for what's written above]

MO> Then, create MAILFOLD.INF inside _O_MAIL\LOCKWOOD\ in your articles
MO> dir:
MO>
MO> MagiC magic_os@onelist.com
MO> List2 mail-list2@some.domain
MO>
MO> again substituting particulars for your actual mailing lists.

Also done. In G:\O\NEWS_O_MAIL\ there is a folder named LOCKWOOD and
I put the MAILFOLD.INF file in there.

MO> You'll then get personal mail into Okami in Mail.lockwood , list mail
MO> into e.g., Mail.lockwood.MagiC . (IOW, POPwatch combines personal and
MO> list mail into lockwood.txt, then Okami separates it out again <g>.)
MO> And any spam you let past POPwatch will turn up in Mail.postmaster :-)

Hmmm, this doesn't seem quite right, as evidenced by my experiment of
downloading a piece of spam I received with POPWATCH, which did not
show up in OKAMI at all (after doing the above configurations).

When I examine the folder to which POPWATCH does its download (and to
which OKAMI looks for mail), I find several text files in there, all
named XXXXXXXX.TXT, where the XXXXXXXXX = part of a name. Looking at
these files shows that these are the emails that are not directed
either to me personally, or to either of the named maillists. In
other words, these are the pieces of spam or forwarded emails that I
have let get past POPWATCH, but are not being imported into OKAMI. So
I can only guess that POPWATCH does not lump everything into one big
LOCKWOOD.TXT file, but rather divides it up into separate files named
after who they are addressed to.

I've taken one of these other files and renamed it the same as one of
my maillists (as done by POPWATCH), and sure enough it's imported just
fine. So I guess I'm looking to include a statement with a wildcard

in either the ALIAS or in the MAILFOLD.INF files that will bring any old text file that POPWATCH wants to create, into a catch-all or "Other" mail fold.

I've tried putting a line like

Other *

into my MAILFOLD.INF file (I tried it as * Other as well) - no go.

I tried putting

* lockwood

into my ALIAS file - still no go.

So, you ask, why do I want to go to all these lengths just to get spam? Well, I subscribe to a number of maillists that are sent out very infrequently (like the CAB list), and to be honest, I've lost track of them all, so I can't specify each and every one. Secondly, I have a friend who uses Quick Mail on a Mac, who frequently forwards mail to me which comes to me, but has her email address in the To: field, so POPWATCH downloads it as THERESA_.TXT, which I have yet to be able to import into OKAMI.

Now I know that this smacks of another thread where a complaint has been voiced over the requirement of THING to have the .app specified for a general purpose viewer, but there is a difference here: I'm looking, even longing, to put an * somewhere to create a catch-all Mail Folder, but I just can't seem to find where.

All I can say is, if configuring THING bores you, then stay the heck away from OKAMI! On the other hand, it works great, and hasn't trashed my hard drive once (he says, crossing his fingers and knocking on wood).

Regards,

Krzysztof Maj wrote:

> How precise is this limit?
> Is it possible, or not - to connect a harddisk 1.05-1.08 GB to the
> internal Host adapter of Mega STE?

The limit is exactly 1 GByte. You can't access any sector beyond this
limit. You can connect, however, a larger drive, if you ensure that
sectors beyond the first GByte are not accessed at all. You have to be
especially careful when you're partitioning because otherwise your last
partition seems to work unless the GByte limit is reached.
Note that you only can connect hard disks to the internal host adapter
that don't do partity checks and don't require initiator identification.
Quantum Fireball and Empire won't work, for example. (You need a
LINK96/97 host adapter for these.)

Message-ID: <366e65a0286ec9a0@holleman.demon.nl>
Source record: 88580

Hi,

right, so I'm using the new beta 4 release of aFTP sometime now, but what I don't like is when it gets an LZH file, it gets the file in, next I see Two-in-one starting up and unpacking the file to a standard dir. I don't want that, I want an option (later) to unpack the file to any dir I choose.

This didn't happen in beta 3, so what's changed? Don't see any option to turn this feature off.
Looks like beta 4 makes use of VA-protocols defined by Thing, but I would like an option to turn this off.

Anyone?

4246. Calamus S on a Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-12-09 00:00:00 UTC
From: Michael Clemmetsen <mc@sin.beetee.co.uk>
Message-ID: <74luvo$9qd$1@pheidippides.axion.bt.co.uk>
Source record: 88581

Hello all,

I can't seem to display colour graphics in Calamus S (note, not SL) on my Falcon. This applies in both 16 and 256 colour resolutions. If I switch to a mono resolution the graphics are displayed (dithered). The manual says that S is colour capable (although some advanced colour handling options are disabled). The problem occurs with Magic 5.1 or Geneva or TOS 4.04 and with or without Calamus virtual memory, i.e. whatever I do I can't get it to display anything (NVDI 4 is loaded in all cases).

Anyone know a fix for this?

Thanks,

Michael

4247. cubase & midi expander on falcon

Newsgroup: comp.sys.atari.st
Date: 1998-12-09 00:00:00 UTC
From: jklimch@paladin.cc.emory.edu
Message-ID: <74lvd9$9nc$1@lendl.cc.emory.edu>
Source record: 88582

Hi,

I just got a used midiman macman midi interface (1 in/3 out). Is there a way to connect it to my Falcon's LAN port? I know that the minimacman will work. There's a lan driver for it it the mros folder. But how about the regular macman?

thanks in advance,

David Klimchak

>and that is on December 31, 1999.

Incorrect, there was no such thing as year -0-. Similar reasoning to how
we're in the -20th Century- at the moment (and not the 19th)..

However, I think the time/date system has been mucked around with so much in
the last two thousand years that the -real- 2nd Millenium probably passed
ages ago! So why not celebrate it Jan 1st 2000? Who really cares what the
technical date is? :)

Regards,
Pete

>

Apparently, the DESKTOP.INF files has been configured to open
VIEW-II.TOS for viewing files.

You should rename the DESKTOP.INF to DESKTOP.OLD, reboot and then save a
new DESKTOP.INF file.

4250. Re: Calamus S on a Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-12-09 00:00:00 UTC
From: curis@capitole.lure.u-psud.fr
Message-ID: <slrn76t4bb.b61.curis@capitole.lure.u-psud.fr>
Source record: 88585

Hello,

Dans son message ï¿½ï¿½Calamus S on a Falconï¿½ï¿½, Michael Clemmetsen a ï¿½critï¿½:
ï¿½ï¿½Hello all,
ï¿½ï¿½
ï¿½ï¿½I can't seem to display colour graphics in Calamus S (note, not SL) on my
ï¿½ï¿½Falcon. This applies in both 16 and 256 colour resolutions. If I switch to a
ï¿½ï¿½mono resolution the graphics are displayed (dithered). The manual says that
ï¿½ï¿½S is colour capable (although some advanced colour handling options are
ï¿½ï¿½disabled). The problem occurs with Magic 5.1 or Geneva or TOS 4.04 and with
ï¿½ï¿½or without Calamus virtual memory, i.e. whatever I do I can't get it to
ï¿½ï¿½display anything (NVDI 4 is loaded in all cases).

For 256 colours, it's a known bug. With newer versions of Calamus
comes a programm for AUTO called falcon8.prg, but I don't know if it can work
with the old S (is there something like that in the distributionï¿½?)ï¿½; I may
send it if necessary, but I don't have it right under the hand so it can be a
little long...

For 16 colours, I don't remeber anything special (except that palette
is changed, so all window elements are black), but I upgraded from S to SL a
long time ago so I don't remember very well...

Did you tried without NVDI ?

this always has been the case.
Just never doubleclick a file in the aftp window. then it won't be
processed.
Just drag and drop the file from aftp to wherever you want on your
desktop.

I think most of us in this newsgroup *understands* your point, but just don't agree.

Big deal if a viewer is integrated in desktop or not. It's *so* easy to setup THING to act the way you want. :)

Is anyone got the driver for the SLM804 (ATAri St)

4255. Need disk for "Synchro Express" floppy disk backup

Newsgroup: comp.sys.atari.st
Date: 1998-12-09 00:00:00 UTC
From: bm827@FreeNet.Carleton.CA
Message-ID: <74me0g$d82@freenet-news.carleton.ca>
Source record: 88590

My kids thought they would do me a favour and clean up around my computers... ("the road to Hades is paved with good intentions"); since that time, I haven't been able to locate the disk for my "Synchro Express" high speed floppy disk backup system by Coast to Coast Technologies (a cartridge which works similarly to the Blitz cable).

If any Good Samaritan could help me out by sending me a copy of the disk contents, which were not very extensive at all, in any shape or form, I would be very grateful.

Thanks in advance for any reply or information,

Randy Kwak

How did you the downloading? For instance if I start the downlaoding by
double click the downlaoding starts but at the end the unpacking prg
(ST-ZIP or LZH shell) comes up. That's because I've setup Thing to launch
these whenever I double click a *.zip or *.lzh file.

Now when I drag&drop the file(s) I want to download to a folder or
partition I download them without these unpacked prg's comes up.

I'm selling the following Atari ST/STE/Falcon games:

(here's what's left)

****
Atari ST (Sierra On-Line) games.
All of them are in MINT condition, in the ORIGINAL BOXES with instructions
and any "extras" the games came with.

King's Quest II - Romancing The Throne
The Black Cauldron
Conquests of Camelot - The Search for the Grail
Police Quest 2 - The Vengeance
Mixed-Up Mother Goose
Space Quest 3 - The Pirates of Pestulon

}}} $8.00 each

****
Atari ST (various titles)
None of these have the original box, but DO come with all instructions and any
extras the game came with. Original disks - tested w/ very little use.

Test Drive II (The Duel)
Test Drive II (Super Cars add on disk)
By: Accolade
*INCLUDES: Instruction booklets, copy protection "wheel".
}}} $5.00

Lotus Turbo Challenge 2
By: Gremlin
*INCLUDES: Instruction booklet, secret "passwords" for extended play etc.
}}} $4.00

Championship Wrestling
By: EPYX
*INCLUDES: Instruction booklet
}}} $3.00

Speedball
By: Image Works
*INCLUDES: Instruction booklet
}}} $4.00

****
Please e-mail if interested (remove SPAM-blocking first!).
I'll discuss any offers / multiple purchases - don't hesitate to ask!

I think what's really needed is the possibility for cheap hardware add-ons.
Such as ISA and PCI soundcards, cheap video cards and so on.

I know, they exist, especially if you use a Milan and all, but wouldn't it
be a great improvement if there are standard calls for (fast) graphics and
sound in Atari operating systems? I know, they too, exist. But what I mean
is something similar to DirectX on Windoze or the VESA BIOS Extensions on
DOS boxes. It really caused somewhat of a revolution in DOS and Windoze game
programming and also paved the way for professional power graphics apps on
those platforms.

Can it be done? Is it necessary? Any thoughts on this?

Wasn't something similar done in Atari's Transputer Workstation 800? You
know, the thing with one Mega ST exnhanced with up to four farmcards with up
to four Inmos T800 transputers, all with their own memory and one common
memory pool?

I believe it also required different ways of thinking when programming apps,
due to the new possibilities created this way. Wasn't the same concept used
later on in IBM's Parallel Transaction Server, albeit with a different
operating system?

>was being sent to.

You are absolutely right. POPwatch can't handle nicknames because NEWSie
doesn't store them in a To: line. I forgot that :(

I think my confusion arises from the fact that POPwatch does have the code
in it to cope ie. if you manually add a To: line with a nickname, it will be
exploded into the real addresses. This indicates that at some point in the
past NEWSie *used* to put the nickname in a To: line. In fact thinking back,
I can clearly remember it *did*. But not any more :(

Regards,
Gary

Hi Frank,

On Wednesday 09-12-98 01:58 (-0700) Frank Lockwood wrote:

>On Wed 09-12-98 01:27,
>Misha O'Neill wrote about Re: Just a little more Okami help please...
>in comp.sys.atari.st:
>
>MO> First off, create the following ALIAS file in POPwatch's directory:
>MO>
>MO> * postmaster
>MO> lockwood lockwood
>MO> mail-list1 lockwood
>MO> mail-list2 lockwood
>
>Done. [substituted my maillist names for what's written above]

</sings> Oh silly meee-ohh! </sings>

You _also_ have to add postmaster into Okami's PASSWD file, or it just
won't import it :-/ So, you'll need a file like:

lockwood::::Frank Lockwood::
postmaster::::Postmaster::

and get it pointed to in O.INF (etcpasswd=...). Also in O.INF, change
'logname=lockwood' to 'logname=' and put #_ENV LOGNAME=lockwood into
your MAGX.INF file.

This should let you bring spam into Mail.postmaster :-)

Also, when you reply to anything there, you'll need to use Okami's
Login menu entry to change to 'lockwood' every time (but it's only
spam) :-}

[snip]
>Hmmm, this doesn't seem quite right, as evidenced by my experiment of
>downloading a piece of spam I received with POPWATCH, which did not
>show up in OKAMI at all (after doing the above configurations).

But personal and list mail are working now?

>When I examine the folder to which POPWATCH does its download (and to
>which OKAMI looks for mail), I find several text files in there, all
>named XXXXXXXX.TXT, where the XXXXXXXXX = part of a name. Looking at
>these files shows that these are the emails that are not directed
>either to me personally, or to either of the named maillists. In
>other words, these are the pieces of spam or forwarded emails that I

>have let get past POPWATCH, but are not being imported into OKAMI. So
>I can only guess that POPWATCH does not lump everything into one big
>LOCKWOOD.TXT file, but rather divides it up into separate files named
>after who they are addressed to.

Once you've set up postmaster as a login, you'll get POSTMAST.TXT here
(with spam in it :-)), as well as LOCKWOOD.TXT with personal/list
mail.

The rest of the *.TXT files here should be just leftovers from
previous experiments (Okami doesn't delete them if it doesn't import
'em). If you still want 'em, merge them with POSTMAST.TXT once you
have one :-)

[snip]
>I've tried putting a line like
>
>Other *
>
>into my MAILFOLD.INF file (I tried it as * Other as well) - no go.

This would only work if the spam was already in LOCKWOOD.TXT (IOW, if
you had '* lockwood' as the first/only line in ALIAS). It would also
import all your personal mail into Mail.lockwood.Other :-(

>I tried putting
>
>* lockwood
>
>into my ALIAS file - still no go.

I don't know why this didn't work, but if adding postmaster as a login
doesn't cure it, do check the following:

It has to be the first line in ALIAS; there must only be one wildcard
def'n in ALIAS; ALIAS must be in the same dir as POPwatch; POPwatch
didn't always use the wildcard feature - you are using a recent
version aren't you?

>So, you ask, why do I want to go to all these lengths just to get spam?
>Well, I subscribe to a number of maillists that are sent out very
>infrequently (like the CAB list), and to be honest, I've lost track of
>them all, so I can't specify each and every one. Secondly, I have a
>friend who uses Quick Mail on a Mac, who frequently forwards mail to me
>which comes to me, but has her email address in the To: field, so
>POPWATCH downloads it as THERESA_.TXT, which I have yet to be able to
>import into OKAMI.

It's fun when you lose track of things ;-)

I'd add the following for your friend's forwarded mail. In ALIAS:

<theresa_...> lockwood

replacing <theresa_...> with her email address up to the @ bit. And in
MAILFOLD.INF:

Theresa theresa_...@her.domain

replacing theresa_...@her.domain with her full email address. Then
you'll get your friend's stuff in a mailfold (Mail.lockwood.Theresa)
all of its own :-)

>Now I know that this smacks of another thread where a complaint has been
>voiced over the requirement of THING to have the .app specified for a
>general purpose viewer, but there is a difference here: I'm looking,
>even longing, to put an * somewhere to create a catch-all Mail Folder,

At risk of being patronising ... are you sure? One of the audio artefacts of RA's compression algorithms is an echo or flanging like distortion. It's great that the TOS platform now has access to RA but the bottom line is that the Internet's too slow for quality streamed audio regardless of what machine you are using, ST or 450MHz PII!

Hi everyone,

Over the past several months I have received numerous emails asking if I had any Atari ST TV commercials in AVI format on the Atari Historical Society website. Several days ago I uploaded 2 new commercials. One is for the Atari desktop publishing system and the other is a head to head comparision of the Atari Mega ST2 against the Apple Macintosh SE, so for all you Atari ST fanatics out there, please stop by and have a look, I have several more ST commercials in the works, so keep checking.

goto www.atari-history.com

At the Main Menu, select Atari Archives, then Atari Sounds, Magazines and Movies, then Atari AVI movies and you will see the 2 AVI movies, click to d/l and view.

If you no longer have a copy of WordPlus or an Atari, then get an
emulator like Pacifist or Toswin, then get the shareware Marcel
wordprocessor. Marcel can convert most Atari text formats to RTF.

URLs in the Quick FAQ of course

Re: Just a little more Okami help please...
in comp.sys.atari.st:

PR> You should put only one line in the alias file for POPwatch for what
PR> you want:
PR>
PR> * lockwood
PR>
PR> Then play with the mailfold.inf file to sort the mails in accordance to
PR> the senders.

Thanks for replying. The problem with this, is that in order to
receive email that is not specifically addressed to me (infrequent
mail lists, mostly) I put a catch all into my MAILFOLD.INF file:

Other *

This sorta worked, but unfortunately it put all the properly addressed
email (to me personally) into a fold called lockwood.other.
Functional, but not very elegant. I've tried setting things up in the
manner described in Misha O'Neill's post (including the line in my
MAGX.INF file), so hopefully that will sort some of this out.

Thanks again,

Source record: 88532

Hi all,

The best ways to contact Steinberg are either to E-mail their product manager, Dave Nicholson, on: d.nicholson@steinberg.de or to subscribe to the mailing list for a while and ask him the question publicly. I have found this is more likely to get a response !

To subscribe, E-mail mats unden at: cubase-owner@makelist.com
or if that does not get a reply, then you can contact him direct on mats.unden@mailbox.swipnet.se

This is a busy list, with loads of postings every day, mostly from frustrated PC users trying to solve their problems. However, the mail messages can be switched on and off via the (CAB unfriendly :-( ) website once you have subscribed to the list.

http://www.egroups.com/list/cubase/

Hope this helps

Paul

Bonjour,

Dans son message ï¿½ï¿½Re: Calamus S on a Falconï¿½ï¿½, Michael Clemmetsen a ï¿½critï¿½:

ï¿½ï¿½Thanks to Emmanuel for this tip.

You're welcome.

ï¿½ï¿½BTW - it also comes with the demo version of Calamus SL98, but I haven't yet
ï¿½ï¿½checked to see if it is the same version.

I think there's a small text in SL 98 normal version (I think it's on
the manual addition) that says there's a bug-fix in falcon8 compared to the
one of SL96, so I think it's not the same one. But I don't know if this fix is
important for S version.

PSï¿½: be careful if you use a HP-deskjet color for printing : it seeems
that printing can crash with Calamus S if there's not enough memory (old
remembering...). No problem with black & whiteï¿½; I don't know for other
printers.

I emailed this clown several times with offers for the SMP-II and Zero-X,
but his asking prices were far too unreasonable.. he expected to get $600
(US) for JUST the SMP-II, if you can believe that.

It serves him right not to get any money for it.

Cross-posted to: comp.sys.atari.st,rec.music.makers.marketplace

FS: Atari Falcon 16 track digital audio workstation,
ADAT lightpipe i/o,
SPDIF, extra MIDI i/o, etc..

-Atari Falcon, tos 4.04, 14 megs RAM, 0hd, clock and
audio mods done
(all/most original docs, box, mouse, etc).
-Steinberg Cubase Audio Falcon 2.06 software with all
manuals, dongle, etc
-Steinberg Studio Module, Cue Tracks, Style Tracks
software bundle
-SoundPool ADAT interface, 8 inputs/outputs on
lightpipe
-SoundPool mixermaps for Korg 168RC digital mixer
-Steinberg (SoundPool) SPDIF interface, upgraded to 20
bit capability
-Steinberg ST-MIDI3 1 input/3 output MIDI expander for
the Falcon
-Screenblaster 2 software/hardware
-NVDI 3.x
-Diamond Back, Diamond Edge software
-HDDriver 5.x
-SVGA monitor adapter

I will include an iso9660 (dos) CDR disk with the setup
info on my C: drive,
so even though no hard disk is included, you could
easily (and cheaply) buy a
SCSI drive and load my setup to get up and running
immediately.

I've received only one offer for $200.. just a little
too low for me to take. If I don't receive a better
offer, I'll try putting this for sale on consignment at
ATY computer in Oakland.

I would like to sell this entire system as a package,
and will accept a
reasonable offer. I am realistic as to the real world
value of this system.

Email me if you're interested...

-Mark

It is mysterious how the 68030 CP (TT) compairs to the Intel-like
stuff:

The following PovRay benchmark in kPixel/s

Celeron 300 4.6
x 300A 8.5
x 333 9.3
P-II 333 8.3
x 450 11.0
K6-2 333 7.0
x 350 7.0
M-II 333 5.0

another table giving 3Dfx (fps) voor 'Unreal 2.17' 640 x 400:
K6-300 27
K6-2 300 30
x 350 32
x 400 36
Celeron 300 A 38
x 333 39
P2- 400 43
I do not know what the Windmachine is doing but it fits.

You see, there is really not much difference in speed.
The range of prices is much greater.

What cost a 68060 CPU now?

Met vriendelijke groet,
Ronald van der Kamp
secretaris Stichting ST

Geneva gives you this alert when it has detected some program or GEMDOS itself trying to access a drive that does not exist. It is a longstanding bug in GEMDOS that once it has tried to access a bogus drive in this way, the system becomes unstable, and is pretty much guaranteed to crash eventually. Since there's nothing Geneva can do to avoid the bug, it does what it can: give you a warning that the crash is going to happen.

So now I suppose you're wondering what causes GEMDOS to get confused in the first place. It has been a long time since I reproduced this problem, but I believe that one way was to try to open a file using a bogus drive letter, like this:

```
Fopen( "\x82:\\foo", mode );
```

Rather than return an error code, GEMDOS tries to open a non-existant drive. Another way to cause this same problem is by using one of the low-level BIOS or XBIOS calls (like Rwabs() or Floprd()) with a negative drive number.

This sort of thing can result from any number of causes, perhaps a conflict with something else that is running, not necessarily a problem in the program making the call. One suggestion I would have to anyone who has both Newsie and a debugger like SysMon would be to trace all of the GEMDOS, BIOS, and XBIOS calls Newsie is making just prior to the alert, and see if there is anything like this going on.

I have a TT and a Falcon, plus a Syquest Syjet drive for each of them. I seem to be able to partition and use a Syjet cartridge on the TT which will then work on the Falcon, but if I partition a cartridge on the Falcon it won't be recognized on the TT. I am using the same version of HD driver on each, V. 7.5. Does anyone know why this would be?
Does it have something to do with sector size?

Seeking knowledge, Mark

I know the problem...I run an 4MB STE and MagiC 5 with Thing and it
does not leave alot of memory to play with.About 2mb.One good point
about Thing is that you can unload thing if you want to use memory
demanding programs like Cab and still don't lose the ability to
multitask.Most programs I use I do keep Thing loaded.

I tried Jinnee demo...I was disappointed and went straight back to
Thing...

I'm trying to set up a small mailing list with NEWSie .92, and it doesn't seem to be working right.

I created a "nickname" for the list, and added all the individual e-mail addresses that make up the list, and then when I write the e-mail out (To: <nickname>), everything appears to be working correctly, and when I send it, it seems to send ok (but doesn't take very long, as if it's not really sending the mail to everyone on the list).

And I've done some testing, and most people report NOT receiving the mail when it was sent this way. Is this a NEWSie bug, or am I forgetting something here?

Don't bother. The game ads were very promising, but the game itself was
a total letdown. Held players interest for about 5 secs. "Lasers and
men" is ten times more exciting, if you've seen that one ;-/
I haven't checked "Bad Mood" for a long time, but from what I've seen it
is obvious you -can- do something Doomy on the Falcon.

You don't. This is all in the Quick FAQ
-Either stick a PC serial mouse into the ST serial port with the an
extra driver
-You buy a serial mouse adapter. There are several ones floating around.
-You can convert a PC bus mouse (if you can find one) or an amiga mouse.
-You buy a real Atari-compatible mouse from your closest mail-order
dealer.

Gordy,

let's put it this way: I value these on my system, the way I work etc.
I've got 68 Mb to play with, running TC mode mostly (I hate to go back to
8 bit or less but sometimes I have to), use the MagiC OS but for some apps
I need to run from TOS 3.06 (and I don't like it).
So both Thing and Jinnee eating up lotsa RAM don't bother me really.
Normally when I have the set up and running I have 3700 kB ST-RAM and 60
Mb TT-RAM and that's with Thing and the whole bunch running.
In fact, I never used Jinnee as I use Thing, since the demo is terrible
with this box poppin' up every minute. But I evaluated the app when it saw
the light and I did like what I saw. Jinnee supports up to 256 colors,
whereas Thing only goes to 16 (that's speaking about background colors,
fontcolors in the fontselector etc.). Jinnee sets fonts in 256 colors.
Different ones for icon labels, infolines, you just name it. Icon labels
can have 256 colors or be transparent (very nice). The springfolder
feature of Jinnee is unmatched, I do hope Thomas gets it done the same way
in Thing. OTOH, using a background picture in Jinnee in 8 bit mode, is a
laugh since Jinnee uses the system palette, where Thing has an option to
use the picture palette. The infonotes feature of Jinnee doesn't exist
in Thing, but I have "Calendar" and "Pinpoint" for that. Setting up apps

for filetypes is great, and tho' some people prefer the way TOS 1.whatever handles that, I prefer to being able to set it up the way I like. Just recently installed Graftool for * type files, at least it displays them right and *in a window* and thus I can print them too, move 'em to the background without the system being blocked. Also I can scroll back and forth in them (now where's that feature in TOS?????)
Then Jinnee has an option to exclude certain drives from deleting files and it has a recycling trashcan feature.

Yes I know it's entirely different when you have only 4 Mb, or a mono monitor, but that's not what I use.

I'm in the process of installing Linux here now, but I'm already sick I can probably only use it in 640x480x4 mode, since there are no drivers for my Matrixcard. Nevertheless, it's probably gonna be worth all the efforts. Also, since I blew up my Modem-2 port, it's very likely I can't use the networking as I understand it won't support the Modem-1 port. Have to look where my serial 3 and 4 have gone...

Hope you understand now why Thing is Nr.1 and Jinnee Nr.2... :-)

By US Code Title 47, Sec.227(a)(2)(B), a computer/modem/printer
meets the definition of a telephone fax machine. By Sec.227(b)(1)(C), it
is unlawful to send any unsolicited advertisement to such equipment. By
Sec.227(b)(3)(C), a violation of the aforementioned Section is
punishable by law.

Hi there Charles,

As far as the web sites go for downloading they all give me that error=-3
and the error while downloading message now. Am unable to use cab to
download anything. As far as the transaction failed message I get it mose
when using metacrawler, and am now getting it when using altavista. It
seems like it starts to fail a little bit at a time and then completly
fails. Like I said before there has been no change in my software or
hardward. his is really weird. HELP! HELP!

Thanks David

Interesting (I had forgotten about TOSbox). How compatible is TOSbox?
I seem to recall it went for "ultimate performance" in preference to
compatibility.

My main interest in the emulator is to run software such as Lattice C
to do some coding (for instance I would like to have a bash at
developing some apps for use with STing so the emulator would not only
need to run Lattice but also STing).

Does anyone know if TOSbox would be up to such a job?

>remove the program or quit it when we shut the Powerbook off. Guess
>which desktop showed up when the Powerbook's owner saw when he turned
>it on the next morning :))
;-)

Well when I had a Mac (Quadra 840av) the only native bit of software I
tended to run on it was MagicMac (though only version 1.05) :-)

I can understand that, though in my case the Falcon hardly gets switched on in preference to the TT :-)

>it for ages - although I have heard it is TOS compatible at times
>where MagiC isn't.
Right, thats the opposite to what I heard about TOSbox. Is there a demo anywhere? Whats the price and what sort of spec. does it offer?

>As for Gemulator - you can run Magic under that.
Yep I remember that, so Gemulator might be better for the variety of OS's and versions it can run, though TBH all of the software I run on the TT I run under Magic v5 fine (well apart from Diamond Back which crashes out on me whilst building the file table for backup).

>PacifiST is good if ya wanna play games...
I haven't played a game on the Atari in years so that isn't a concern.

>As I haven't used anything apart from MagiCPC really I am unable to
>answer your question in any qualified manner.
Thats fine, all opinions are collated and compared ;-)

My main interest is in running the likes of Lattice C and STing.
Papyrus and Texel would also be an advantage but TBH I tend to use MicroSlop products in that arena now as thats all work uses.

>the docs are to be believed.
Hmmm, I have Calamus SL 98, Papyrus 5, etc which would be nice to run
but my main criteria are Lattice C and STing (though Everest, OLGA and
CAB would be nice for those HTML sessions ;-)

>unzipping a largish archive (eg 600k) with ST-ZIP is almost instantaneous,
>where it would take an age on the STE. On the other hand, CAB and Papyrus
>do still seem slow sometimes compared to native Win95 stuff, but I guess
>that's predictable.
Well I knew about the NVDI limitations (MagicMac v1.05 had similar
problems without NVDI). One worry would be that the emulated system
would appear to slow to be usuable to me (I have long been away from
the STe or STFM, having owned both a Falcon and TT for a number of
years now), It will definately be slow on the laptop (its main
intended victim) which is only a lowly second hand IBM Thinkpad 755CX
(Pentium@75Mhz, 40Mb RAM, 1.4Gb harddisk).

>Sound support seems to be limited to the odd beep. Even programs which
>don't need DMA sound don't seem to produce anything so far, which I had
>thought would be OK, not that it's a major problem.
Well MagicMac v1.05 also had problems with sound, though I would be
very suprised if they had done nothing about this in the meantime.

ooooppps!! I should have read more carefully Nicholas!
you can modify a PC bus mouse.

maybe you should add the fact that Mario Becrofts Serial Mouse Cable
allows you to plug in pratically ANY PC(Mouse systems or Microsloth)
Mouse to your atari.
I have one and it works with *every* pc mouse I've tried(cutsie,
logitech, microsoft, ... I've tried ten different brands, on my MegaSTe
and Falcon)
Now, not _all_ 3 button mice work as three button mice (left
button-regular click, right button-right click, middle button-double
click) but they do work as two button mice.

A pc "bus mouse" can be modified to work with any atari.
All the other pc mouses are only with (serial) interface.

Gary, et.al.,

Indeed POPwatch handles Nicknames as implemented in earlier versions of
NEWSie. I've never upgraded from NEWSie 0.82('cause it does all I need
it to) and POPwatch handles those nicknames OK.

the package you have can handle it, as can the new Extendos Gold.
In Extendos Gold they also have an installer that has screens for
you to set up the multi changers - but I don't think this existed
in the older version. Wayne

There is a piece of software that allows you to use a PC serial mouse
via the ST's serial port. Obviously you would need a 9-25 pin gender
changer.

I can't remember what it's called, I've got the program somewhere!!!!!

: It works fine on a PC, but I can't get the bugger working on my Atari.

Actually, I haven't used it on an ST, but on TT and Falcon. It works fine on my machines. I'm using HDDriver 6 as my hard disk driver, and it has support specific for the PowerDrive.

I would suggest that you try different hard disk drivers, and perhaps try pulling or replacing the terminating resistors on the PD. I can't recall whether there are any, but I know that I have to fiddle with these on several of my devices whenever I change configurations.

Since I'm using the PowerDrive with HDDriver, I can also use BigDos and format a PD cartridge as IBM compatible. This means that I can plug the PowerDrive into either a PC (w/SCSI) or any of my TOS machines, and they can all read and write the same PD cartridge.

I missed the original message here (I've been avoiding this thread due to
the custard pie throwing...), so apologies if you want something to print
graphics this way.

If you want something to print text via GDOS/NVDI which can be installed
as the desktop printer take a look at IdeaList. It works with MagxDesk for
sure and I'm pretty sure it will work with Thing - Hallvard recommended it
to me and I think he's a Thing user.

I've never used Lattice (I'm not a programmer), so can't advise either way.
My *hunch* would be that if it wouldn't work under MagiCMac it may well not
work under MagiCPC.

I had a brief correspondance with Danny Bhabuta about MPC before I took the plunge. IIRC he was of the opinion that a P120 was a sensible minimum, speed wise. The whole speed thing is weird, as computationally it seems to fly (as with ST-Zip unpacking), yet without NVDI the graphics seemed to crawl (eg jerky mouse pointer etc) - NB I didn't try juggling the settings so this may have been fixable: NVDI fixed the problem anyway. That said, CAB unpacking a JPEG seems unbearably slow considering the near instantaneous display in Windows-native apps. Calamus' redraws are still noticeable, too, but then I have no idea how it performs on a TT. Compared to the STE it's a great improvement. I guess you could try the demo version (sorry, I don't have a location for it) and see if your apps run at a reasonable speed, bearing in mind the absence of NVDI.

It seems that MPC6 has DMA sound support, also it doesn't have the 14Mb memory limitation of 1.2, so let's hope SysSol can release it soon.

From: Ian Numan <iannuman@netspace.net.au>
Message-ID: <3670FB78.3476A632@netspace.net.au>
Source record: 88485

Hello fellow Atarians

I am just getting into Atari emulators for the PC after wanting to play
some of my old ST games.
I have downloaded "Gemulator Classic 3.80" and "PaCifiST 0.48" to compare
the two emulators.

Gemulator Classic uses a "Virtual Hard Drive" in the form of a
CDRIVE.VHD file, which I understand has a limit of 32MB for each virtual
drive, (up to 4 I think).
The default CDRIVE.VHD contains a file SHDRIVER.SYS which I understand
is needed to access the hard drive, (and therefore gain access to the
"Virtual Hard Drive" files).

PaCifiST uses an actual (not virtual) directory on the hard drive and
mounts this directory as "HARD DRIVE-C".
The default directory is STFILES, but this directory doesn't contain
any hard disk drivers.
Does PaCifiST need a hard disk driver?
Do I need to install one, or is a driver already built into PaCifiST?

Cheers
Ian

4332. PaCifiST and Space Invaders

Hello fellow Atarians

One of my favorite Atari ST games is "Space Invaders", written by
Robert HC Leong in July 1989, which is joystick controlled only.
I cannot get past the main menu.
Pressing any of the directional buttons or the fire buttons on the
joystick will only move the cursor UP, and pressing any of the arrow keys
on the keyboard will only move the cursor DOWN, nothing can be used as the
"Fire" button to actually start the game.
Has anyone got this game to work with a joystick?
I know my joystick is working with PaCifiST as I can use it with another
Space Invaders game, but not the one written by Robert HC Leong.
I have tried changing the JOYSTICK=YES/NO in the PACIFIST.INI file.
When JOYSTICK=NO, the numeric keypad is supposed to emulate a joystick,
but it won't work with this game, (number lock is OFF).
Any ideas???

Cheers
Ian

4333. Re: FS: Falcon/CAF/SMPII/Zero-X (last chance)

I don't know why I cannot see the other responses to this thread in my newsreader (I see them in dejanews) but anyway..

$400usd is ALSO too much for an SMP-II, IMHO. You can buy an Opcode Studio64XTC that not only has 4 MIDI inputs/outputs, SMPTE, etc like the SMP-II, AND it ALSO features ADAT control, word clock, SMPTE, superclock, etc.. for $350. I offered $200usd for the SMP-II, a fair price in today's MIDI/audio marketplace, IMHO.

The problem is people buy technology and don't see how technology changes.. I still LOVE my Falcon audio system, for example, but it certainly is worth nowhere NEAR what I paid for it! Why? Not because it's old.. but because there are other systems that do more for the same money I paid for the Falcon. I'm selling a Falcon/Cubase system now (see the post below in this newsgroup) and certainly don't expect to get anywhere NEAR the $3000 or so I paid for the thing..

4337. HD Driver Woes

Newsgroup: comp.sys.atari.st
Date: 1998-12-11 00:00:00 UTC
From: Mark Simpson <marksimp@integrityonline7.com>
Message-ID: <3671BCA9.76373061@integrityonline7.com>
Source record: 88491

Hi, Im having serious trouble with HD Diver v7.55

Here's a breakdown of what I've been going through the last
few days.

Goal, Using EZ 135 carts to transfer files between my
Macintosh 8100/80AV PPC, OS 8.1 (EZ 135 Drive on external
SCSI chain) and my C-LAB Falcon MK1, HD Driver v 4.52/5.13
(No internal Drive, Quantum 240S drive, and Yamaha CDR400at
in 4 bay external SCSI tower, with an external iomega JAZ
drive, and an external EZ Flyer drive chained to that).

1) After figuring out how to initialize and mount an EZ
135 cart on the Mac, I was unable to partition it in any
format recognizable to the Atari, nor was I able to
partition it in any format on the Atari that would be
recognized by the Mac. I was able, however to re
init/partition it so that I coud read/write to it on the Mac
only.

2) Tried deinstalling v4.52, and installing v5.13, but
this did not help.

3) Tried deinstalling HD Driver altogether, and
installing ICD Boot from ICD Pro disk that came with the
Falcon. Did not know how to set things, so I experimented,
and was unable to get anything that woud work to be read by
both machines.

4) Reinstalled HD Driver 5.13. Drive partition names
became shifted and I was never able to fix this. In other
words:
-My Quantum was previously Drives C through G,
and these
remained unchanged.
- My syquest EZ flyer was a single partiton
(drive H), and
it became Drive L.
-My JAZ drive was previously drive partition I
through L, but
those partitions became M through P, unless
the CD-ROM
was active, in which case it was P and the
last JAZ partition
would become inaccessable.
-Under MagiC 4/Ease 4 in the system folder the

letters of the
missing drives would show up at the end of
the list, and could
not be selected/opened.
This is very strange, as I had peviously been able to
switch back and forth between ICD Pro, HD Driver 4.52, and
HD Driver 5.13 without ever having any wierd side effects.

5) Tried to establish communication between the two
computers via modems, but that was becoming more trouble
than it was worth. Was unsuccessful in my few attempts at
this, and didn't want to get too into it knowing that data
transfer using this method would be pretty slow.

6) Placed an emergency order of HD Driver v 7.55 (sent
my disk and manual in via next day mail, and received the
program via e-mail (using the Mac to receive and unzip it),
to use while waiting for the manual/disk top be mailed.

7) Deinstalled HD Driver 5.12, and ran HDDRIVER.PRG to
enable the use of HDDRUTIL.APP. I tried to run the app,
which loaded okay and gave me access to
formatting/partitioning the drive, but would crash (4 bombs
and the app quits) whenever I tired to install the driver.
It also showed drive D as the first drive, and although
Drive C would show up on the desktop, it couldn't be opened,
and all of the datat that is normally on drive C (my boot
partition), is now accessible via opening drive D. everthing
else was moved accordingly.
-the quantum was drives D through H
-the EZ flyer was drive I
-the JAZ was drives M, N, O, & P.
-Partitions J, K, & L could not be opened (non-existent)

8) Getting frustrated, I repartition the quantum, trying
various, formats and partitioning schemes. In every case whn
I run HD Driver 7.55 the boot drive shows up as "D" and the
C drive doesn't exist. If I try to use HDDRUTIL.APP to
access the HDDRIVER.SYS file in any way, such as installing
the driver, or messing around with the driver settings, the
program crashes. Even though the program crashes, a diver
does get installed on the "D" drive, however, trying to
select it from the HDDRUTIL.APP file selector causes the app
to crash, so anything other than partitioning, formatting,
and initializing, cannot be performed. If I try to
de-install the 7.55 driver, I'm informed that no suitable
partition was found.

9) getting tired of playing around, I completely
reformatted and repartitioed the drive using ICD Pro (ICD
was used to originall format the drive many moons ago when I
first hooked it up to an STE via Link I). The drive now

showed up with an accessible drive C once again. By now I've got the JAZ and EZ Fkyer disconnected so that I can eleiminate them as possible problems.

10) I re-install HD Driver 7.55, and all the same things happen; crashes when installing or trying to modify HDDRIVER.SYS, the missing "C" Drive, etc.

11) Now I disconnect the quantum/CDR mini-tower, all MIDI cables, My, Cubase audio artridge key, FDI and JAM 8 out, the modem, and printer. I hook up the syquest EZ flyer up to the SCSI chain using an entirely different cable this time, so that there is nothing but the monitor, the power cord, and the EZ Flyer connected to the SCSI chain.

12) I install a freshly partitioed 230 meg cart (partitioned a couple days earlier using HD Driver 5.13), and try installing HD Driver 7.55 to this disk. Same thing, It crashes when I try to access/install the driver but shows up on Drive "D" (with Drive C being non-existent and unopenable). Like the others, I can read/write to this Drive "D" partition, but can't mess with the driver.

Hopefully Dr Seimet sees this post soon, and with my description of the problem knows immediately what the cause of my problems are. Even more so, I hope that the solution does not require money or time, as I have neither. Please help me resolve this problem soon, as I need both machines up and running and trading data soon. I have a project I promised a client before Christmas, so that it can be given as a gift.

Thanks,
Mark Simpson

Hey gang, I haven't been on this newsgroup in ages. Last time I was looking for someone to convert some PC and Amiga based Atari 2600 development tools to the ST, alas no luck. But if anyone would like to take a crack at it take a trip to Bob Colbert's 2600 programming page
http://www.novia.net/~rcolbert

Anyways, I used to love using the program Art & Film Director for the ST, by Epyx, to create animation files (.FLM format). What I'm looking for is a program that will convert .FLM animation files into something like a .AVI or .MOV or some other similar PC standard.

The coverter doesn't have to run on the ST, a program that will do the same thing on the PC will be just as fine.

I want to put some of my old animations on my webpage in a more widely accessable format. Plus it would be fun to make some new animations on the ST again.

Art Director was my favorite low-rez 16-colour drawing program for the ST. It had some pretty neat features in it and would let you work on a lot of different images at once. It's just too bad you couldn't have any desk accs running when you used it.

Film Director was probably one of the simplest animation programs I've ever used. I made some pretty twisted, warped, distrubing stuff with it back in the day. :) I think my favorite was "How To Take A Flying F___ At A Rolling Donut". Very twisted. Film Director lent itself quite well to doing that Monty-Python-like animation style.

My only suggestion would be to try one of the other Atari ST emulators. Winston is probably the most likely to be successful if Pacifist won't run it. You can find Winston at

http://winston.fatal-design.com/

Version 3, which promises a lot on enhancements, should be out soon.

Good Luck

4341. MagiC 6's Desktop parameters, help, please

Newsgroup: comp.sys.atari.st
Date: 1998-12-12 00:00:00 UTC
From: cstanley@zetnet.co.uk
Message-ID: <74scgi$2ee$1@roch.zetnet.co.uk>
Source record: 88398

Hi guys!

Having got Magic6 up and running, I've trouble with fonts in the Desktop and Selectric file selector. Here are a few lines from Newdesk.inf which I am not sure I have set up correctly:-

```
#_FLG 129
#_OBS 8 16 0 0
#_TXB 1 0 6
#_TXS 1 0 4
#_WND 32
#_INW 0 0 1 6
```

The result is the font (Monaco) is too small; if I change TXB to 1 0 8 and TXS to 1 0 6, it's too big for the space allotted (also in dialog boxes).

I have studied the annotated sample Newdesk supplied, but cannot work out what I've done wrong.

Also the file selector is muddied by black lines above and below any items that are selected.

Addendum: since installing this and NVDI 5, pop-up menus (or sub-menus? - e.g. in Profile 2) are unusable, causing the mouse to disappear: any thoughts on this too?

Thanks for reading this.
Charles.

> nevertheless it don't work

Ah, but it *does* work on my STE!

I mailed Simon Coward after your experiences and he said if I'd managed to
get it to work to update the docs as necessary (he hadn't tried it on an
STE, but others told him it didn't work). I haven't done so as I didn't do
anything different to his instructions: you bung the patch into the auto
folder and check it runs after the clock setter program for
Forget-me-clock. If you set the FMC year to something less than 2000 it
adds 20 years to it.

To be sure, I've just tried it again. Set the clock arbitrarily to 1984,
rebooted with the patch active and then inserted the current date in
Papyrus: 12/12/2004. No problem.

I haven't the foggiest idea why it works for me and not for you: it just
worked first time for me.

What I *can* do is add something to the page to the effect that it seems to
work for some systems and not others. Certainly it's fine on an STE with
MagiC 5.03 and a Forget-me-clock. Otherwise it seems a shame to deprive the
people for whom it will work just because it won't for others.

> Has anyone managed to get a SCSI PD drive linked up to their ST?

I have it connected to my TT for more than two years now and found it to be the most reliable removable media device I ever had since the SyQuest 44 MByte drive. No problem using it, neither in Macintosh mode (only one LUN) nor in PC mode (two LUNs) with HDDRIVER as hard disk driver and SPIN! as CD-ROM driver. I recommend to use the PC-compatible mode with two LUNs though the Mac compatible mode also works and might be especially interesting with upcoming versions of SPIN!. It doesn't matter if you have an ST instead of a TT, this will work in any case. Note that you can download both HDDRIVER (demo version) and SPIN! for a test. (Note that SPIN! requires MagiC or MiNT to be installed):

Yah, same goes for me. I've been looking and looking and I can't really find any free/shareware so the next thing I guess is to buy something. If you can help me (I'm looking for both a terminal program and a BBS program) please e-mail me. It would be better if I could run them off a disk because I don't have a HD for my ST yet, but I'll take what I can get. 8*)

4353. Multi-user systems

Newsgroup: comp.sys.atari.st
Date: 1998-12-12 00:00:00 UTC
From: Brent Thirsk <thirsk@telusplanet.net>
Message-ID: <36727B4C.2A3C@telusplanet.net>
Source record: 88410

Does anyone else out there use their Atari as a multi-user system.
If so, it might be nice to trade ideas instead of each of us
trying to re-invent the wheel.

Source record: 88413

I had some computer problems for a while, apparently mostly related to a SparQ drive. (I got the SparQ on the recommendation of our good buddy Al Fasoldt, who I hold in no way responsible. Everyone was hyping SparQ this spring.) I had to have my fixed HD reformatted and set up, and in the meantime the SparQ was sent back for exchange, but I had used it for my backup. The SparQ isn't back yet, because of SQ's bankruptcy I guess, so I couldn't restore the backup. I'm not sure I should, anyway, because if the cart is messed up it might mess up the head on the replacement if and when I get it.

A lot of my Atari stuff was on the backup, but I can still transfer a bunch from the TT (which I still have until I can get the data off a couple of external hard drives, which is going to take some experimentation with jumpers, etc.). I haven't yet reinstalled Aladdin ST, but was having some problems accessing Genie previously. Lately, e-mail I send to Genie addresses gets bounced, and I'm wondering if Genie is still running. If so, post my greetings, and tell them I'm plan to return.

Things are going much better, now that I'm backing up to a Jaz. I hope to get Gemulator running again soon, and may look for some advice here on that. I have it on my office PC, and use it regularly there.

I read the messages here for the first time since spring, and was happy to see so many oldtime friends. I put your e-mail addresses in my address book. I shoulda just posted a note for you to write me, and they woulda gone in automatically, but that would have been too easy. Drop me a note, anyway.

> 1 0 8 and TXS to 1 0 6, it's too big for the space allotted (also
> in dialog boxes).

First, the "6" is the height to use in ST-low and ST-med. For ST-High and above, you need "13". "8" was too big because the VDI's default font exists three times: small, medium, and big. Depending on the value for the pixel height, the VDI chooses one of the three and doubles its size, if necessary. Pixel height "8" is the icon font doubled, which is too wide to fit into 8 pixels.

It's a bit confusing, but the width of the default font is not always proportional to its height.

Second, you've signalled MagiC the font is proportional. Is that really true?

I actually wonder what you try to accomplish, anyway. The lines you've quoted will simply use the system font (if that's Monaco, then this was done by NVDI as a replacement), as if the lines weren't in magx.inf.

> I have studied the annotated sample Newdesk supplied, but
> cannot work out what I've done wrong.

Just the note that it's magx.inf, not newdesk.inf ...

Ciao

>MFM, and a few ESDI drives.

You have to upgrade your ST to TOS release 2.06
That's a smal board with two eproms that contains TOS 2.06 AND the
IDE interface. (I can't remember the name of the board in the moment)

But i also can't say how you can get the board.
I stop with ST 5 jears ago, falcon only ..

To ad SCSI devices ist much easyer, without soldering.
You need an DMA->SCSI Hostadaptor like "LINK '96 /'97 That adaptor allowed
you to connect ANY SCSI device to your ST

Forget MFM, RLL, they are ALL old and realy slow.
An very old german project called: "OMTI-Billiglï¿½sung" allows to
connect one/two MFM/RLL devices with an special selfmade DMA-Adaptor
to the ST. But an urgend point is that this project work only with
a PC Card "OMTI 5522 or OMTI 5520" 5522 is an PC RLL Controller, 5020
is the MFM version. You MUST have one of this controller.

The ST DMA adaptor is cheap, only a handfull of parts.
Otherside, you can't boot from this drive.

I use that hardware 4 years by me self. Works great. Cheap.
But it's realy old and slow.

Best way is DMA->SCSI

The OVL you are using isn't working with the search engine you are
using anymore. It's probably that the search engine has changed how it's
software worked.

Send the URL of the search engine to the author of the OVL you are
using and have them take a look at it.

Message-ID: <74ujp3gps1@reader2.wxs.nl>
Source record: 88425

Hi,

Since my Falcon died, and bought a Milan, I have some items I
can't use anymore. But maybe someone else can...
So I have the following for sale. Please contact me if you
are interested.

1) KILLING IMPACT = a superb arcade game for Falcon only: Fl.30,-

2) EPIC (platinum edition) = cool starfighter game for ST(E) and
Falcon (with Backwards III): Fl.25,-

3) ZERO-5 = also a great starfighter game, Falcon and STE only: FL.30

4) MUSICOM 2 from Compo Software = Harddisk recorder/ sampler program
for Falcon only: Fl.35,-

5) NCS CD-ROM with Falcon demo's: Fl.10,-

6) INSHAPE INTRO = 3D modeler and shader, optimised for Falcon:
Fl.99,-

7) ROBINSON'S REQUIEM CD-Rom = fantastic but difficult adventure
game: Fl. 50,-

8) CONCERTO from microdeal = midi sequencer, able to play samples,
ST(E), TT, Falcon: Fl.25,-

9) THE MIX MACHINE = digital recording and editing of music ST(E):
Fl.10,-

All software is in good shape. Inshape Intro is never used because my
Falcon died before i could buy myself a coprocessor.
All prices are in Dutch Guilders, if you want to know it in your own
valuta, try: http//www.altered-states.co.nz/currency.htm
Shipping is extra.

Thanks.

Source record: 88429

Thank you to all who helped with the problem of an Epson GT-5500 not working with Look2 on a DirecT60 (Hades). In particular, Jan Persson pointed out that an older version of Look2 worked with his Hades whereas newer versions did not. I was able to confirm this - his version (1.09) works on the DirecT60, my version (2.04) does not.

I think that there were other problems associated with the SCSI interface, possibly the id number, but all is now sorted. *What* the problem was remains unclear.

>
Hi Dan,

It's nice to see you here, I appreciate your expert advice on this problem.

Here is a little more info about what Newsie does on my TT.

I'm convinced my problem is NOT with Geneva itself. If I run Newsie88 to 94 from the Atari desktop, even with nothing else loaded I have problems. The error message I get from the TT TOS is "Drive : is not responding Please check the diskdrive, or insert a disk". The A drive motor starts running, and the drive light stays off. I can hit return to cancel the warning, but the drive continues to run. The only way to stop the drive is to do a disk read from the desktop or the file selector. If I am reading one newsgroup and try to select the next newsgroup from the group list, I get the "Drive : is not...etc", but hitting return won't make it go away. It's interesting that the warning message omits the drive letter, and that the drive light doesn't come on.

I'm using Newsie 86 with no problems, so it's probably some code that was added into Newsie 88, and is still there. I have received input from other TT owners who have similar problems to mine, and also some who have no problem. It must be at least partially caused by some variation in the TT hardware, something about the drive configuration.

I'm not a programmer, so I doubt if I'm capable of making much sense out of the information from SysMon. But, I'm willing to try it if SysMon is on some FTP site where I can download it.

I'm using my Falcon this way, it's basically a KGMD-setup that I've tweaked and upgraded for two years. The only thing I'm missing is AppleTalk of some sort, I would like to connect the Powerbook to my Falcon (LAN-port) and share disks and printer. So if anybody is planning on porting Netatalk let me know...

Here's what I still have left in stock for the Portfolio (all items are NEW), and are basic items that all Portfolio owners should have:

- Portfolio Owner's Manual
- Portfolio Quick Reference Card
- File Manager/Tutorial ROM Card
- File Manager User's Manual

You can have all of the above items for $10 plus shipping. Let me know if you're interested.

On the card it says "Biodata VME-bus Ethernetcard". It has two sockets - one 15 pin D, and the other a co-ax. Only other feature is a green LED. I haven't pulled the card yet - but will if it will help...?

J > sound unavailable' ... was'up?

There are at least two 'sound.cpx's that I have tried on this TT
(also has dma sound). One doesn't work for me, the other does. IIRC,
the one that doesn't work does exactly that ('stereo sound
unavailable'). If you would like a copy of the other, email me. The
one I use has a file size of 12804, dated 08-20-90.

4384. About STOS

Newsgroup: comp.sys.atari.st
Date: 1998-12-13 00:00:00 UTC
From: Marti Van Lin <ml2mst@csi.com>
Message-ID: <#342oGsJ#GA.299@ntdwwaaw.compuserve.com>
Source record: 88351

Hi,

My name is Marti Van Lin, I was born on June 4 1961 in MaaSTricht the Netherlands, where I still live.

I am a real computer-freak in general, so I don't care what its operating-sySTem or whatever is, I just can't get enough of these "toys" ;-)

In the paST I used MSX, MSX2, Amiga 500 and a few PC's (XT, 386DX, 486DX) and at the moment a Pentium 166 MMX (much 2 slow)....

However the Atari ST always was my dream computer, because of its on board MIDI.

But it always STayed a "dream" because I never owned one.

And yet with PaCifiST and WinSTon, at leaST I can run some Atari ST ware on my Pentium.

By the way I used GEM already on my XT!

And in the mean-time I downloaded STOS somewhere and as a Basic programmer, I think its safe to say that STOS is the moST powerful Basic dialect ever!

STOS is already a reason to buy a Atari ST or at leaST to emulate it!!!

My queSTion is: where can I get a legal version of STOS with documentation in the Netherlands?

Because the Atari (Mega) ST (E) is ALIVE!!! and the ML2MST (my handle and callsing of my CB Packet Radio STation) is about to create some great new STwarez.....

Love,

Marti Van Lin, the ML2MST
http://come.to/ml2mst

I have two ST's laying around doing nothing. They are both 1040's with 1 meg of ram.

I'd like to add some more memory. I don't understand the do it yourself upgrades on the web.

And heck, if I'm going to spend the money, I might as well get the most RAM that I can, right?

Im interested in the German ?Magnum? 16 meg board. Anybody have one? Comments/Criticisms?

Do they ship to the US?
How hard is it to install?
I'm pretty sure both of my ST's are tos 1.0, so how much is the TOS 2.6 upgrade that they Quick Faq says I'll need?
Will there be any problems with mint?
Oh yeah, How much is it? I tried a converter, but I don't even know if I picked the right product. The converter said 339DM is $220.

Thanks!

4391. Hard Drive problem

Newsgroup: comp.sys.atari.st
Date: 1998-12-13 00:00:00 UTC
From: tcjspencer@zetnet.co.uk
Message-ID: <751iut$ro6$1@roch.zetnet.co.uk>
Source record: 88358

I run the Atari, monitor, hard drive etc. off separate switched plugs having had problems in the past with switches packing up, so each item is switched on at the relevant socket.

About 10 days ago the hard drive did not start when switched on so I checked everything plugged in properly and it worked when switched on again.

On Friday when I switched the hard drive on there was a bang and smoke from the plug/switch so I replaced the lead and plugged it in another socket and it worked OK. Today whilst being used the drive suddenly went off after about 20 minutes or so. When the switch was turned off and on again again it started and is working fine at the moment.

Neither the drive nor the lead had been moved or touched.

Has any one else had this problem? If so I would appreciate any ideas.

>
>Is anyone aware of any Atari apps that will convert a GEM file into a DXF file?
>If yes, where can I find it?
>
>I hate to use Corel Draw on a PC just to convert a few files.
>
>

I don't know of any app that will do it directly, but using several utilities it should be possible: There are several applications that can read .GEM and ecport .CVG; then, DynaCadd comes with two utilities called C3D2DEF.TOS and CVG2DEF.TTP; as the name suggests the last one converts Calamus vector graphics into some .DEF format that DynaCadd reads. DynaCadd can then export .DXF file (something like Autocad 10 or Autocad 11 compatible).

But maybe it is simpler to use CorelDraw...

Btw. I used Corel Draw ONCE, a couple of years ago, to convert some .GEM drawings into .DXF and do a little editing of them at the same time. I do not remember which version of Corel Draw it was, and I do not know if everything was set up properly, but I remember that it was a 66 MHz i486 PC with 8 MB of RAM (a standard machine at that time). Each simple operation (zoom, select object, move, delete...) was SEVERAL TIMES slower than in Megapaint 4 on my 8 MHz Mega ST with 4 MB...

Cu.

4401. MetaDOS vs. CD Recorder Pro

Newsgroup: comp.sys.atari.st
Date: 1998-12-13 00:00:00 UTC
From: Mark Simpson <marksimp@integrityonline7.com>
Message-ID: <3674980C.581286A6@integrityonline7.com>
Source record: 88368

Hi,

In the midst of trying to get HD Driver 7.55 to work on my falcon, I decided to reformat my main drive and start from scratch, in the hopes of eliminating as many possible causes as I could, (I also completely removed all drives from thier towers so as to try them seperately, but that's another story). To make a long story short, the backups I had on syquest carts, were older than I thought, ao now I can't get MetaDOS workin, thus preventing me from getting access to all the various backups I have on CD-ROM. In short, I've spent a weekend in Atari hell.

After installing MetaDOS 2.70 on my hard drive, I can open the CD ROM Icon, but there is a single file called "TRACK_01.PRG" sized at 76 bytes. This is always the same regardless of what CD is in the drive, but the file cannot be opened.

When I first installed this CD-R drive along with CD Recorder Pro 2, I had the same problem. Mathias Pohl, solved the problem for me by giving me a special .BOS or DOS, or .??? driver to use with the falcon and MetaDOS, and I think I had to use an earlier version as well. I can't remember the specifics and unfortunately I archived the e-mail conversations on the very CDs I now cannot gain access to.

I've e-mailed Mathias again, but I know he doesn't check his e-mail but every week or two. I'm hoping someone here uses MetaDOS and CD Recorder Pro on a falcon, who knows exactly what I'm talking about, and can send me, or point me to the proper files to solve my dilemna.

Right now the whole Atari side of my system is down, and I need it kinda badly to finis working on a project.

Thanks in advance,
Mark Simpson

Hi Jim,

I have a copy of sound.cpx which does this - like it's the wrong
version (for Falcon?). But I also have a sound.cpx which _does_ work
just fine :-)

Mail me if you'd like a copy...

Send an e-mail to my friend Brian. He programmed some incredible Atari ST BBS Software a few years ago, and while he's not _presently_ actively doing any ST programming, he still has everything, and it's free!

It's called Foresight, and I've posted about it here a few times in the past.

E-mail him at: bhauer@tsotech.com

Tell him Nurmix sent you!

Great, have heard that name floating around before. Can you or someone
else pass along a url, e-mail address, snail mail address, or something
that we could use to contact the author about purchasing/registering
the software?

If it is no longer available, anyone have the latest version that they
would sell?

James,

I still have one NEW 1040ST keyboard in stock in the parts department. Price was $90, but I really have to clear out my remaining ST stock, so you can have it for half price ($45) and I'll throw in FREE shipping within the continental United States (48-state area). Let me know if you're interested.

Payment can be by credit card (telephoned voice) or money order (mailed).

Sounds as there might be short in the mains connection somewhere. If
you are not used to dealing with mains voltages then get someone to
test everything for you. This might include the house wiring. Was
the fuse blown in the first lead which blew up?

If the file has been produced by a program 'print_to_disk' driver
(and this may *not* be what the above says), then in TOS and
TeraDesk it is possible to simply to drag the file onto the printer
icon. I do not use multitasking desktops and cannot say if such an
icon exists in them.

| . . . .

My experience of using Calamus to print small text sizes is that its output is not as good as that of Papyrus using TrueType fonts. This is not of benefit to you but I would be more interested in using Calamus if it could directly use TrueType fonts.

Look II works on Hades/DirecT60, you just have to set the caches correctly. It has been awhile so I can't recall the exact settings. Also, sometimes it misses the device when scanning the bus, you just try again and usually it works the second time.

This was tested with ES600 ands ES800, don't know about your GT (Euro model numbers).

Using True Type fonts is not the complete answer, the ability for "aliasing" fonts is. This likely will never happen in Calamus since it uses a vector outline font tech. Papyrus uses aliasing to smoothen fonts, as do postscript capable packages such as DA's Layout and PageStream. NVDI also adds this capability, last I heard anyway.

AFAIK the bridge 3 module for Calamus allow you to convert GEM into DXF.
You can find a demo version of Bridge 3 (and Calamus SL 98) on the
homepage of Invers media.
You can the URL on the UTSI pages. Follow the text/POA link.
For the URL of the UTSI, see my sign off.

4428. Need cable for ReNO portable CD-ROM

Newsgroup: comp.sys.atari.st
Date: 1998-12-14 00:00:00 UTC
From: "Stephen A. Risik, O.D." <risik@mindspring.com>
Message-ID: <01be27a0$e43239a0$d04e56d1@server01>
Source record: 88308

I understand that the ReNO Portable SCSI CD-ROM drive was popular among Atari ST and Amiga users --- or at least it was available with drivers for the Atari ST and Amiga computers. I picked up a drive for peanuts but need a cable to connect the drive to a PCMCIA (SCSI PC Card) adapter. The cable has a standard PCMCIA connector on one end and a seldom used "Centronics" mini-connector on the other end. If you have such a cable you're not using and want to sell it, or know of a computer store/dealer who might inventory such, please contact me via e-mail.

TIA

Steve

Hi,
this information came with CAB.OVL which you can download from Dan
Ackerman's site at http://www.netset.com/~baldrick/. It seems to me
though that the settings in CAB itself override those in DEFAULT.CFG;
as stated in the CABOVL.TXT they are merely passed on to CAB and not
all of them are essential. Good luck, Joost.

Hello everyone,

Can someone *please* help me ?

I'm changing my ISP from Demon to Zetnet, and I've got STiK running on
the Zetnet account (VERY slow, though) but I'm having *incredible*
difficulty sorting out Oasis 1.35 :o(

I've tried the Zetnet support website, but now everything's just in a
helluva mess (lucky I still had this old Oasis 2 setup !).
Has anyone managed to get a (standard) 14 meg Falcon running
STiNG/CAB/POPWATCH and Oasis 1.35 (all in single TOS) in harmony with
Zetnet ?

If they have, would they be kind enough to advise me, or better still, mail
me copies of their Startup.Nos, Dial.Txt, etc. file to me, please ?

If anyone can help, they'd *really* be saving my sanity :o)

Thanks in (hopeful) anticipation,

See ya,

Mark.

```
Hello,
My problem ist, I don't know how to transfer *.st diskimages from PC
back to AtariST?
I tried the program MakeDisk but I don't know the specifications of an
AtariST floppy disk drive
(tracks, sectors), therefor my ST can't read the disks I have created
with MakeDisk.
Can anybody help me, please?
thx,
Martin Fajt
```

> I'm actually looking for the complete version
> of Substation for my dear STE with 4Mb+ Hard Disk !
>
> Where can I find it ??

Try 16/32 Systems in the UK (Grand Bretagne).

Their email address is 16-32@premier.co.uk

Postal address 16/32 Systems,
173 High Street,
Strood,
Kent,
ME2 4TW
United Kingdom

Telephone +44 1634 710788
Fax +44 1634 295895

When I last saw an advert for them, Substation for the STE cost 19.00 UK Pounds + 1.50 UK Pounds postage to the EU. They accept American Express, Visa, and Mastercard.

Hope that helps!

Cheers!

James

#Hi All,
#
#Anyone using Straight Fax 2.1 on a Falcon with MagiC? I can't get it to
#dial out? Can someone send me their modem settings?

Hi Chris!
I use STraightFax 2.20 on the above mentioned system. As
far as I can see, the only settings that would make any difference to
the dialing out would be the Serial port settings. In my version I
have a choice between Device 6, Device 7 (modem port) and device 8. I
am still unsure which is the correct one as 6 and 7 both work equally
well?? I have nothing in the Modem Init string, just left it blank and
this seems to work with most Fax machines (but not all) Perhaps there
should be something in here? However that should not stop the modem
dialling out. As far as I can see there is nothing else that could
affect the dialling?? I assume you have the dialling type set to
Touch Tone (if that is appropriate in your area) This program has
just always worked for me and so I assumed it would for everyone!!
Stupid thought I guess. Does the program actually access the modem
at all, i.e. does it go off hook when you click on "send Fax"? If it
does then there may be a problem with your address book settings. Do
you remember to deselect the "Shedule Fax" button before selecting the
number, this fooled me for a while, apparently the default settings
are always to delay sending so the Fax is queued until the appropriate
time arrives! A shot in the dark but worth thinking about.

Anyway, good luck, should you require any more specific information do
please get in touch.

Regards.

>dealings with this man you should ensure you have the money or the goods off
>him first. Anyone else out there had this happen to them

I have a totally different experience to you...

I have sold Steve a ton of stuff over the past year and in most cases
have sent him the goods before he has paid. I am impressed by his
honesty and his promtness in paying soon after.

I would be inclined to believe him if he says the computer must have
broken in transit... The Post Office aren't that careful even if you
write 'FRAGILE' all over the package - they just don't care and chuck
packages.

Information about the proxy settings are included in the docs for CAB.OVL
(either CABOVL.TXT or CABOVL.HYP), as they are a function of the OVL/CAB
rather than the TCP/IP stack.

With STinG you can set these up in either DEFAULT.CFG or your DIAL.SCR if
you have more than one account with different settings for each. With STiK
these variables had to be in DEFAULT.CFG.

Hello Katherine,

k> This is just a GEM shell for the excellent djpeg.ttp program.
Just got it. :-)

But if someone needs a DJPEG shell which also has to work with MagiC ("RSC

not found"), plain TOS ("Wrong AES call"), systems with less than 16
colours
(black dialogue) or ST low-res (unusable dialogue), look at your favorite

Atari FTP server for eXtended Info (XINFO) at the utility/packer-shell
directory. ;-)

(But it's a very old, huge German program of mine: No AV-protokol or
BubbleGEM, but also for CJPEG i.e. to compress all TIFFs/GIFs on a CD-ROM
to
JPEGs on a HD ;-))

PS: Both shells are written in GfA-Basic though :)

Greetings, Oliver

Hi,
it's in the docs that come woth CAB.OVL which you can download from
the authors site: http://www.netset.com/~baldrick/. However, it seems
to me the settings in CAB override those in DEFAULT.CFG; these are
merely passed on to CAB. Just read the docs, good luck. Joost.

4442. Falcon stereo channel problem-part II

Newsgroup: comp.sys.atari.st
Date: 1998-12-14 00:00:00 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <367598C5.5EA2@primenet.com>
Source record: 88322

My right side channel won't seen to work now. I have been tinkering with it for about 2 days now, I did find that if I hook up a microphone and turn the gain up on the right all the way, I can "force" really loud sounds through the microphone and into the right channel...and some loud games barely are able to get a hint of garbled grainy sound through. It's almost like something is squelching out normal and quiet volume sound from the right channel. Normally I get zero sound from the right channel. This problem just started sometime in the last few months.

Can anyone take a guess at what could be wrong here, or how I could fix it? Thanks. -Satcom2

Your last hope is if audio can be fiddled with in the Falcon's CMOS settings (see earlier post here) and somehow something's got changed. BUT i don't know much about Falcon's (STe for me) so i may be wildly off the mark. Otherwise sounds a bit nasty to me Satcom. Hardware problem. Blown op-amp, fried resistor, dead capacitor? If you are experienced with micro-electronics and can get hold of Falcon schematics and service manual including diagnostic charts then you might be able to fix it. Otherwise leave it to an engineer, equals $$ of course, sadly.

I've fried at least 2 STFMs ignoring the 'no user serviceable parts inside' warning. Still I learnt quite a bit in the process ... thank god i don't own a car, it'd be forever in pieces! ;)

Close: it's a kind of translation layer which lets you use STik/STinG
clients with MiNTnet.

> > Minix - another OS?
>
> Yup, another Unix flavoured OS. Also MiNT's filesystem.

MiNT just uses the filesystem bit, rather than any other bit of Minix, I
think.

No, STinG does not do CHAP. Are you sure that Draconis does ? I had thought
it doesn't.

For the ISP, it's very rare that ISP would refuse PAP and request CHAP. Often
technicians say CHAP is required when in reality they meant CHAP works too
(besides PAP).

Source record: 88328

Hi-

I'm writing with a specific problem (a) and a question (b) about
something in Nicholas' QuickFAQ...

a) I recently bought a Mega ST4 with 2 Megafile 30 drives and
except for some slight keyboard problems (I'm going to be working on
cleaning it up soon), the whole system was doing fine until about a month
ago. Now , I cant see the partitions on the 2nd drive. The previous
owner had set the drives up with 3 equal partitions on each (that is
C,D,E and F,G,H) but now my machine doesnt recognize F, G or H. These
problems started after I moved the machine so I'm wondering if it was a
physical problem caused by transporting them or if it might be that I have
just stupidly connected them improperly. I am really not sure how to
diagnose my problem and could use some help. I've got new DMA cables and
Ive also tested the drives with and without the installed Neodesk...

b) I have the possibility of getting my hands on a 200 MB SyQuest
drive and was struck by something in section 3.2.2 of the FAQ:

"In order to use SCSI peripherals, and unless you have an internal Atari
interface (Mega ST, Mega STe) you need a SCSI host adapter"

Does this mean what it seems to imply: that I would not need the
ICD Link or other hardware thingy to connect the drive? Or is it just
certain Mega STs with this capability? What WOULD I need? Should I just
go back and read the FAQ again?

Thanks a bunch for any insight any of you might have ...

Rick Brown

There are quite a lot of words and abbreviations that I am still
trying to learn. Here's a start:

XHDI compliant - a standard for hard drive compatibility? What
does it stand for?
Cab - ST web browser?
Stick - a PPP program?
Gluestik - Similar to STick?
MiNT - multitasking program. Does this replace TOS or add to it?
MintNet - ?
FreeMint - ?
Minix - another OS?
MinixFS - filesystem with long filenames, need Minix?
AFTP - Atari FTP?
DuFTP - ?
Newsie - Newgroup reader that handles email?
TAF
FIFFI
PPPkit - Everything you need to get on the internet?
Oasis - Newsgroup reader with email?
N.AES - a new AES replacement (for all STs?)
Thing - DEsktop replacement like NeoDEsk?
MT-Newswatcher - Newsreader?
Nemesis - ?
NOSTalgia - ?

Any additions and corrections would be greatfull.

Hello Mark:

I have a TT, and it works fine, but here are some suggestions.
1. If there is a Cache setting on the falcon, turn it off.
2. You could be running it in the wrg resolution. Try a ST Hi Res.
(I don't know how you set your res. on a falcon , but if it is anything
like a TT, you just set it under preferances on the desktop.)

Hope this helps.

Myself...I really like BIAB! the beauty is in making your own styles,
which gets into the algorithmic aspect of it.Good Luck.!

>graphics this way.

The original request was for a utility that would print any file verbatim
that could be installed as the print utility under Thing.

The hunt is actually on behalf of a fellow CiXen who wants to print files
that have been produced by a printer driver direct to disk in the background
without having to load the original prog again.

Custard pies get eaten or deleted! :-))

>If you want something to print text via GDOS/NVDI which can be installed
>as the desktop printer take a look at IdeaList. It works with MagxDesk for

That works as you say, but an alternative is needed in this case.

Thanks for the feedback.

4460. Calamus Fonts

Newsgroup: comp.sys.atari.st
Date: 1998-12-14 00:00:00 UTC
From: lwright@spamola.silk.net
Message-ID: <MPG.10de712514b10d8f989793@news.silk.net>
Source record: 88380

I used to have, many years ago, a utility to convert TrueType fonts to the Calamus format - does anyone have this util? Of course, TT fonts are very common, but Calamus fonts aren't quite so, and I'd love to be able to use some new fonts.

I've got softs to trade, if that would help motivate you. =)

Thanks,

Lawrence.

4461. FS: Atari ST stuff (San Francisco, CA)

Newsgroup: comp.sys.atari.st
Date: 1998-12-14 00:00:00 UTC
From: Makoto Nagata <mnagata@micronova.com>
Message-ID: <3674DBF2.1A45B6E@micronova.com>
Source record: 88381

I have the following Atari ST stuff for sale:

hardware:

1040ST Computer
SH204 disk drive
SC1224 Color monitor
SM124 Monochrome monitor
Monitor Master (mono/color switcher)
Happy Computers Discovery Cartridge
4 Kraft MazeMaster joysticks (3 unused)
Epyx 200XJ joystick (unused)

books:

Atari ST Internals (Abacus #2)
Atari ST GEM Programmer's Reference (Abacus #3)
Atari ST Tricks & Tips (Abacus #5)
ST Disk Drives: Inside and Out (Abacus #13)
The Concise Atari ST 680000 Programmer's Reference Guide (Peel)
Midi and Sound Book for the Atari ST (Enders/Klemme)
68000 Assembly Language Programming (Kane/Hawkins/Leventhal)

software:

Metacomco Lattice C
OSS Personal Pascal
Metacomco Cambridge Lisp
GST Macro Assembler
Signum 2 Document Processor
plus a lot of diskettes

All in excellent working condition.

I prefer selling all these as a package to somebody who can
come to San Francisco to pick up, but any offer will be
considered.

If you are interested, please send email to mnagata@micronova.com.

> Does it have something to do with sector size?

Yes, exactly. Please have a look at the maximum partition sizes in the
partitioning dialog box online help. If you limit your partition to less
than 512 MBytes they can be used with the TT as well as with the Falcon.
Otherwise MagiC or Big-DOS or FreeMiNT 1.15 are required for the TT.

eXtended Hard Drive Interface maybe ??? Not sure what it implies
actually.

> Cab - ST web browser?

Yup, one of several.

> Stick - a PPP program?

STiK actually - a TCP/IP stack that handles the old SLIP protocole.
Doesn't handle PPP
STinG is much newer and better and handles PPP/

> Gluestik - Similar to STick?

A port of STiK for MiNT (I think)

> MiNT - multitasking program. Does this replace TOS or add to it?

MiNT - MiNT is Now TOS. A unix-like multitasking GEMDOS replacement.

> MintNet - ?

Net extensions for MiNT

> FreeMint - ?

The latest MiNT. The original one was (c) Atari

> Minix - another OS?

Yup, another Unix flavoured OS. Also MiNT's filesystem.

> MinixFS - filesystem with long filenames, need Minix?

same thing I think...

> AFTP - Atari FTP?

Yeah, an FTP client

> DuFTP - ?

same

> Newsie - Newgroup reader that handles email?

yup, and FTP too. requires STiK or STinG

> TAF

Toronto Atari Federation

> FIFFI

Fiffi - An email client from Ash

> PPPkit - Everything you need to get on the internet?

Nope, old and obsolete. Forget it.

> Oasis - Newsgroup reader with email?

yup.

> N.AES - a new AES replacement (for all STs?)

Actually, it goes with MiNT.

> Thing - DEsktop replacement like NeoDEsk?

yeah, or like Jinnee

> MT-Newswatcher - Newsreader?

Never heard of that one. Newswatch maybe, which is a newsgroup retreiver
(not reader) that goes with Okami an Popwatch.

> Nemesis - ?

A Falcon accelerator board.

> NOSTalgia - ?

An ST emulator for the Mac

a possible diagnostic

software problem or hardware problem?

Stick a lead in the audio outs and put a multimeter across the other end
(one dog clip on the screen one on the signal), use the resistance setting.
Any audio coming out of the falcon should cause needle to move. Also
probably worth using something like a game as this will most likely address
the audio hardware directly thus avoiding any confusion with possible
settings in software/os

I have one in my STFM which is in turn cased in a Lighthouse Tower case.

My thoughts at the time were that it might not be possible to fit it into a standard case because of the need to pack it up on extra DIL sockets to allow it to clear the MMU clip that was already in use for a 4Mb upgrade.

There might also be incompatibilities with other addons such as accelerators.

>Do they ship to the US?
Dunno.

>How hard is it to install?
Quite easy if you can unsolder the original processor cleanly and solder a socket reliably. Budget for a new 68000 if you have to cut its legs.

Can't answer the remainder of your questions, but I'll add that earlier versions of MagiC wouldn't allow floppy disk access until V5.11 IIRC.

I also reviewed the board in Atari Computing BTW.

You could also change you keymap.inf file as following:

*H alert "[2][Do you want help?][Yes|No]" && help
*S msgsort 0
*N msgsort 1
*D msgsort 2
*F set-msg-flags
*K set-msg-flags +k
*P set-msg-flags +p
^R set texteffect.mode ; redraw
*U unsubscribe
*A save-adr
I import
E export
X expire
B save-binary f:\uencoded\
M save-mid c:\clipbrd\mid.txt

Meaning: Running Okami, press B (from binary ;-)) The attachment
will be saved in the dir f:\uencoded\. Can be any folder of course.
Makes it possible to point to a partition with enough space
Bye Bram

Not sure, but these drives should probably be parked before transport,
with park.prg or something like it.

It sounds like the second drive isn't recognized. Does AHDI see it when
booting up ? If not, it might just be a cable problem.

Some Mega STEs had an internal host adapter, the one that was available
for the Mega ST was a 3rd party one, so you probably haven't got one
installed. You do need a SCSI adapter.

One thing you could probably try is putting the 2 megafile drive units
into one case. I think there are connection for 2 drives inside each
case.

Mine is actually! An old mini that spends as much time with the bonnet
open than closed.

Actually, you need to set the drive ID to 0 for the Atari to recognize
it, as it is set to 1 as default for PCs. The problem is with recent
drives that don't have any jumpers.

4481. Free Atari Software and Books

Newsgroup: comp.sys.atari.st
Date: 1998-12-15 00:00:00 UTC
From: Martin Haehnel <martin.haehnel@gmx.net>
Message-ID: <367634EA.ECC9D920@gmx.net>
Source record: 88248
Cross-posted to: comp.sys.atari.st,de.com.sys.st

Hi

Is anyone interessted in some books and original Software
for Atari ST? I have to give away the following for free until the
end of February. Otherwise I have to throw it away:

Software (original disks german with german handbooks):
Optidisk secure defragmentation of harddisks
TurboST der Software Blitter software graphics accelerator
Themadat Assoziativ database
Omikron Draw! 3.0 drawing program
Leonardo ST graphics program
Signum Fonts fonts for Signum
Deja Vu
Script word processing
Wall Street Wizard
Gunship
Neodesk, Neotools another desktop for the ATARI
Voc Royal vocabulary program
Leisure Suit Larry II
Zak McKracken
Sim City
Balance of Power strategy game
RVF Honda motorcycle racing
Steel

Books for the ATARI (german):
Das grosse MEGA-ST-Buch
Der Schnelleinstieg Script II
Der Schnelleinstieg Calamus
Das grosse Calamus Buch
Scheibenkleister II Massenspeicher am Atari

Source record: 88249

After 4 months of waiting for a TT RAM card replacement that
never showed up, I can say it now:

A I X I T S U C K S ! ! !

They keep on saying "we send it tomorrow" but it was 4 months
ago already. About 3 dozens of similar replies later, it has
become very clear they do not intend on ever sending anything.

Therefore, I suggest you all boycott Aixit products.

Given that kind of lousy support, no wonder I'm so pissed off
about the whole Atari thing.......

4 months without my TT ..... *sigh*

>been broken in transit? Was it insured?

Just as a bit of help for anyone else sending parcels of hardware/software through the UK mailing system:

Standard 1st or 2nd Class letter post includes compensation up to 26 pounds for loss or damage, but it's better to obtain a free certificate of posting from the PO at time of posting, this helps prove that you actually sent the parcel. Compensation above 26 pounds has to be paid for, there are two levels using the Registered Post service. Recorded Delivery doesn't get you any extra benefit other than a signature from someone who takes your parcel in at the address it is delivered to.

If using Parcelforce, you get 20 pounds loss or damage compensation as standard, above this it costs you 75p for up to 150 pounds value and 1.30 for up to 500 pounds value of compensation.

If dealing with someone for the first time it's always wise to pay the bit extra. I've sold a lot of surplus Atari stuff over the last couple of years and had no problems, but I do use the Certificate of Posting or Registered Post services as necessary. This protects both vendor and buyer.

OOI, it is the buyers responsibility to claim from the Post Office for any loss or damage to parcels. The PO will then investigate the claim and will contact the vendor and ask them to provide full details of what was sent, and where and when sent from.

Hope that helps someone! :-))

Kind regards

Mike Kerslake

FaST Club in the UK sell loads of commercial quality Calamus fonts at a very low price, plus lots of PD/shareware ones are available from them at low cost. Floppyshop's DTP+ CD includes loads of Calamus fonts, and it's currently on special offer from them, so if you have access to a CD-ROM, it might be worth investigating.

Kind regards

> Cheers Peter

Thanks for the reply!

I m not sure if PAP is also supported, but I have tried hard to get a working link, with nu success. I tried to log on to a provider with PAP and got a working connection at the second try. Still, I know the login procedures are often not the same for different providers.

I don t know much about the Draconis package, other than what is said on the DOC s at the homepage. There is stated that it supports CHAP, but maybe that is not the current version.. ...well I don t know.

However, I tried to logon to my (CHAP) ISP, with Draconis as well, but it didn t do the trick either.

I ll try to check with my ISP if the CHAP is really needed, or if just plain PAP will be sufficient.

Regards,

Joakim

Hey Lawrence,

Sorry, I came into the thread late.
Do you have a bunch of TT fonts and want them converted to CFN?
If so, I might be able to help you.

>
The name 'Biodata' suggests that is is a product from the German firm
that made the Bionet for connecting ST's to a DOS-server.
I was thinking that they only made boxes for DMA-connection, but
maybe they also made them in a VME-version.

If this is the case: I have software for ST/TT and PC MS-DOS (server).
(and 3 boxes and a dos-box).

So there is a possiblity to use it for 10 mb network.

Further more: there are MINT drivers for Bionet.

But I am not sure: there also was a VME-card called Riebl that could
carry the name 'biodata' outside. May be, may be not.
So open the machine and have a look on the card.

Well, under MiNT it works just great. Why should she bother to get the
shell working on MagiC? MiNT in combination with N.AES is the OS of the
further not that very buggy MagiC.

SingleTOS doesn't know about half the calls I do in jpegem.
For magic, and it's RSC not found, well, sorry can't help it there either, but jpegem is NOT the only program reporting that it didn't find its RSC in magic. As you've noticed, in MiNT and SINGLETOS it DID find its RSC, so my guess is that magic here is somewhat not 100% compatible. But well. no further comments on magic.

Magic users IF they really want to use such a tool just can use the TTP. It will work as well, if not better than the GEM shell.

3) I did this tool as a freeware, because It is a tool made for myself AND that I don't use magic anymore. so I can't waste my time trying to find some fix for magic users..

SINGLETOS won't work, don't even try, as it even use some calls to see if the child process is done/exited or not.. Which of course, SINGLETOS doesn't know at all, too old..
Magic, I don't know how it handles pexec 100, and check for child processes. Black dialogs? well you know if your AES doesn't support C_ICONS, there are 2 ways.
Either the program you run will use it's own lib, or lib that use c_icon no matter the aes.
OR second is to use COLOR_TT patch. Which patches the AES of your TT (there is a version for older aes too!) to support c_icons, just like on newer aes.

> >
> >Atari FTP server for eXtended Info (XINFO) at the utility/packer-shell
> >directory. ;-)
there you go, magic users and singletos users can use that.. Nothing to be mad about. Sorry if I use some MiNT calls in my program, but it just happens that there are MANY MiNT users out there, and half the power of it used because of magic/singletos compatibility. I am fed up with this, I just want to do/use a tool that fits me and my OS. Not others restrictions. If CAB for example doesn't use threads/forks it is because of the singletos users, and magic users. So still waiting for CAB to

display a picture or formatting, when it could do something else more
useful.

yes, this will work.

MiNT is Now TOS. Let's move on, shall we?

4502. Magic, Mint/Naes or what?

Newsgroup: comp.sys.atari.st

Hi everybody, and I mean E-V-E-R-B-O-D-Y !!!

I was thinking about this MagiC/N.AES-Mint thing going on...

This dead platform is about to divide into two camps...

With the Milan having entered the scene and probably others to follow, I dare ask: Who's gonna set the standards then?

Listen, Atari themselves never bothered to set a standard, they issued TOS as the OS for Atari and every bloody soul programming for it was welcomed to do so. Using "undocumented features" or not, go ahead!

We've seen what the results were, haven't we?

So, next came MagiC, and perhaps they've set things to their own liking.

Another one is Mint/NAES, who did exactly the same.

Listen, I'm a user, and I don't run 2 OS-es. (Well, mainly I run MagiC, and if that's not working OK, I run TOS).

What do we want??? Another Microslut, telling us "This is the standard or go screw yourself!" or what?

Do we want an about died platform to continue into two different directions or do we want a platform to go on to serve users?

I'm about to test Linux on this machine, and I'm glad at least Linux heads one way...

Can't say that for the Atari stuff: one programmer sez' "don't care about MagiC users", the other one sez' "forget about Mint", as a USER I say: "who da fuck are you to set standards? Let the user decide!"

Perhaps MagiC and Mint/NAES should come together and create a super OS for Atari, with all the programmers following the same line.

Open doors? Well, be glad they're (still) open! It's perhaps about time to decide on what and where...

In the meantime, I do wish everyone (that's spelled E-V-E-R-Y-O-N-E) a Merry Xmas and the best for 1999. Let's just try to make the best of it!

wrote:
>If Steve Stupple is so honest as you would suggest then why has he neither
>returned the Portfolio or paid the requested money for it. Parcel Force

Hmm.. as far as I remember you two had a deal - it was a fair swap. he
owes you nothing as you have the 286?

>said that the computer he sent was inadequately packaged therefore liability
>lies in the hand of the sender Steve Stupple.

When you received the computer did you tell parcel force at that time
about the state of the packaging? If you weren't in and they left the
parcel somewhere - did you inform them straight away that the
packaging was crushed/whatever? Are you suggesting it was because of
the packaging that the computer was broken - so in fact it did get
broken IN TRANSIT rather than Steve sending a broken one.

Your claim, matey, lies with the Post Office.

Out of interest, what values do you place on the Portfolio and the
computer (I guess they are both the same value as it seems you had a
straight swap) - so what price did you set?

Regards
Danny

I was spammed by someone via hotmail some months ago and put 'hotmail' in the killfile with instructions to delete any mail with this origin. A couple of times recently I have been aware that there were fewer e-mails in the inbox than there were supposed to be.

If anyone was trying to e-mail me from hotmail then I am afraid I did not receive them. I have killed the killfile. Could you try again?

Yes! Exactly! It has been awhile since I used it since I don't have a scanner
anymore, but this was the cache setting that was required. Thx Martin.

You will have to open the case, unplug the power and flat cable
remove the screws that hold the old one in and reverse the process
for the new one. It should be straightforward. Try and get a floppy
with jumpers to select the drive number. I'm not sure how essential
this is but I once had difficulty using a pc floppy with no jumpers.

Why should he? You each sent a parcel through the post, one was
damaged, one was not. If both had been insured there would have been
no difficulty.

You saw the state of the parcel when it arrived. Did you sign for it
as being undamaged? Was there no padding?

|
|I see, sorry, I came into the thread late and missed the "stripes" portion of
|the problem.
|
|Now this being said, I have never seen this problem. Which resolution/bit
|depth are you using?

The stripes are thin, alternatively black and white, and the spacing
depends on the resolution with the number of stripes in the scanned
image increasing as the resolution increases.

I can send you an image if that would help.

Firstly may I just point out that I have had 3 weeks of computer hell, my ST is not setup for the internet as I am still sorting the hard drives out. Over the last 3 and a bit weeks, my PC has been a bugger. It has either made reading email impossible, or I've not been able to respond completely etc... I have just managed to get the system working where I can actually read my email, news items, and access my mailboxes; yippeee:)

This has caused me a delay in everything, including being able to arrange to meet someone whom I was unable to contact due to their contact details are hidden in a mailbox. Ah well such is life.

Response 1

In article <753n00nei1@newnews.global.net.uk>, user <voyeur69@altavista.net> writes
>I recently sent an Atari Portfolio to Steve Stupple in exchange for a >286 laptop computer.

This is true, no problem on this:)

>When it arrived it was broken, allegedly in transit.

At first I would agree that it arrived damaged, I will return to this point later!

>Steve Stupple was then asked to return the Portfolio or pay me thirty >pounds for it.

I don't think 'asked' was the keyword.

>He has failed to do either. I suggest that if you have any >dealings with this man you should ensure you have the money or the >goods off him first.

Fine I have never asked anyone to part with goods without being paid for them first. Many people do actually trust me and I rely on word of mouth, I don't rip people off.

>Anyone else out there had this happen to them.

If there is anyone, then they haven't dealt with me. I've been buying Atari gear for many many years and I've sold a few Atari items. What I do is not a business as the intention is not to make money, although it may be nice once in a while, what I do is a hobby of which I do attempt to make it recover some of the running costs.

I am not going to cover everything here, because I have also spotted another article in this thread and will tackle this at the same time as clearing up some bits. I have most of the email that this 'user':

User <pumptek@globalnet.co.uk> or is it S&J <voyeur69@altavista.net>

Namely: Stephen Hansbro

sent me.

Has anyone else had dealings with this chap?

I have nothing to hide AT ALL.

I do expect that Mr Hansbro to have copies of ALL my mailings to him, I wonder if he would be willing to make available his reasons for not replying to many of my emails!!!!

I would have brought this event to a satisfactory conclusion, if it wasn't for my son going into hospital and depleting my funds. This in turn delayed any possibility to settle this problem, this would have also STOPPED the threat that Mr Hansbro gave me.

It was his threats that started me thinking and looking into things further.

I will continue this in reply to Mr Hansbro other posting.

Response 2

All right Mr Hansbro posted 3 and not the 2 I originally thought.

In article <756550$2j0$1@newnews.global.net.uk>, User
<voyeur69@altavista.net> writes
>If Steve Stupple is so honest as you would suggest then why has he neither
>returned the Portfolio or paid the requested money for it. Parcel Force
>said that the computer he sent was inadequately packaged therefore liability
>lies in the hand of the sender Steve Stupple.

Now if it wasn't to Mr Hansbro threatening me, bad move as I hate
threats, I wouldn't have looked further into this situation. I noticed
something that made me start wondering and feeling suspicious, something
was just not right.

The only email I don't have, unless it's on the Atari, is the one where
Mr Hansbro wrote demanding to know where the laptop has got to.

I am going to show you the email Mr Hansbro posted to me.

On Thu, 17 Sep 1998, TIME 13:32.
Subject: Toshiba Has Arrived
[
}Hi Steve,
}
}cancel that last message. I had no sooner pressed the SEND button on
}the computer when the doorbell rang and it was Parcel Force with the
}computer.
}
}Many thanks
}
}Steve
]

Please NOTE the time, I wish I could get my hands on the first mailing
to compare that time as well.

Now is it me, or would you actually open the parcel to make sure
everything is in order BEFORE you acknowledge receipt!!! Wouldn't a
person open a package and make sure everything is as it should be BEFORE
acknowledging receipt!!!!

Now look at the next message:

On Thu, 17 Sep, 1998 TIME: 17:05
Subject: Broken Toshiba
[
}Hi Steve,
}
}I have unpacked the computer and the screen is broken. The glass has
}multiple large cracks across the screen. I have contacted parcel force
}as you said you had despatched it compensation paid, and they require
}you the sender to contact them and they will send you a form to claim.
}I would however appreciate a phone call from you to discuss this. My
}telephone number is [no I'm not that cruel].
}
}Many thanks
}Steve
}
]

Correct me if I'm wrong, but from 13:32 to 17:05 is about 3.5 hours (around 210 minutes). If the computer was broken on arrival, why did it take so long to tell me so? Mr Hansbro was quick enough to tell me it HADN'T arrived! But took more than 3 hours to tell me it was broken!!!

What's more, wouldn't the broken screen make a sound when you moved or was given the parcel? I had a picture sent to me with a glass pane, and I could hear the chink as the postman got out of the van; now that's glass and paper, what would glass and plastic/metal sound like!!!!

Was my mistake telling Mr Hansbro that I had sent it via parcel force compensation paid!

I have people many things here and abroad, as many people reading this will know, I have never had any problems with my packaging. The laptop was packaged with that much padding that I'd expect it to bounce when dropped, in a dead bounce way. I was aware that packaging a parcel too tight can cause added pressure to the contents, even though the Toshiba T3100 case is extremely strong. The parcel weighed in a 8Kg, so I'll leave you to work out where the weight came from.

I contacted Parcel Force and they requested an invoice or something proving the cost of replacement. I did a lot of chasing up going and ringing second-hand shops in a 20ish miles radius along with some computer supplier etc. with no one able to give me a quote on how much it would cost to replace.

All the time I wrote to Mr Hansbro and kept him informed, like this one:

>On Wed, 23 Sep 1998, S&J writes
>>
>>hi there,
>>just wondered if you have heard anything from parcel force regarding the
>>Toshiba computer
>>
>>many thanks

>>Steve
>>

And my response:

23 September 1998 19:11
Subject: Re: Broken Computer
}Hi
}
}I posted the form and am still awaiting their response.
}
}Cheers! for now
} Steve

To cut this down a little, most of the email Mr Hansbro sent me I replied the same day if not sooner. Unfortunately it seems to take Mr Hansbro a little longer or impossible to inform or even acknowledge receipt of mine!!!! Why????

Like this one, I receive and replied the same day:

[
}On Tue, 20 Oct 1998, S&J writes
}>Hi Steve
}>any news from Parcel Force as this whole affair is beginning to drag
}>on
}>
}>Steve
}>
}
}Hi Steve
}
}I wrote to them a stern letter last week, and to date have not heard
}anything. I agree with you it's dragging on a bit, If they don't get
}their finger out and get this resolved, I will have to consult my
}solicitor etc.. It's already cost me a fortune in petrol and phone
}calls.
}
}I will keep you up to date.
]

Now why Mr Hansbro can't acknowledge or reply to my mailings, I wrote this to him the last attempt (either 3rd or 4th) to get an acknowledgement was on 1/11/98!

[
}Hi Steve
}
}Is there anything else you may be interested in, as they are refusing
}to cough up.
}
}I am trying a do a couple of things:

}
}(1) get a replacement plasma screen.
}(2) I'm looking out for another laptop.
}(3) if you want something else.
}
}I am hoping to see my solicitor and see what they say about the
}situation and may be the media.
}

I expected a reply, or was this too much to ask? As no reply was
forthcoming.

I never even got an acknowledgement, just the usual mailings. This is
the type I mean!

[
}On Sat, 7 Nov 1998, User writes
}
}>Hi Steve,
}>
}>I think this has gone on for long enough. I agreed to swap the Atari
}>Portfolio for a working laptop computer and unfortunately, through no
}>fault of my own I now find myself with a damaged computer. The
}>carriers except no blame as they think it was insufficiently packaged
}>so I would be grateful if you could return the Atari Portfolio or send
}>me a cheque for 30. I am sorry if you think this is unreasonable but
}>the whole saga has gone on long enough.
>

}Have you changed your email address, as I've written to you several
}times.
}
}The last time I wrote, I mentioned that I was looking for a replacement
}screen for the laptop, or a replacement laptop.
}
}I also asked if there was something else that you would be interested
}in, or wanting.
}
}I have been waiting for while for your reply.
}
}I'll send you the 30 quid a.s.a.p. My son is going into hospital next
}week, and so I will be travelling to and from Swansea all week; plus I
}am expecting a new method of getting a drug into my arm any time, and
}so I will have to attend hospital to have this fitted as soon as it
}arrives. I just hope I can get my son out before that arrives.
}
}Swansea is around 50 miles away, and I'm having to make arrangements
}for my other son. This is going to be costly.
}
}I can appreciate your concern, I am the one that's going to be out of
}pocket with this deal. Everything was suppose to be straight forward, I

}didn't expect Parcel Force to break the computer let alone then
}criticise the packaging. I have spent a great deal of time and money
}complying with parcel force's requests etc. and I will be trying to get
}them to pay for the parcel to get back to me.
}
}I will settle up with you a.s.a.p, if you are looking for something
}else in payment, let me know and I'll see what I can do.
}
]

Still no reply or acknowledgement.

Why wasn't Mr Hansbro informed of the arrangement for Parcel Force to inspect the parcel. According to them they had arrange to inspect it, so why did Mr Hansbro arrange for his son to deal with the inspector?

I must thank Danny, Leigh and many others for their support in response to this.

If anyone disagree with my attitude or can answer some of my questions, drop me a line and let me know.

The laptop supposingly with a broken screen, isn't useless as you can attach an external monitor to it.

This is not correct, Atari has never encouraged the use of
"undocumented features". The fact that everybody can program
GEM-programs without having to pay big bucks is what has kept our
platform alive.

> So, next came MagiC, and perhaps they've set things to their own liking.

Definitely.

> Another one is Mint/NAES, who did exactly the same.

MiNT/N.AES is much closer to MultiTOS than MagiC has ever been, so if
you absolute want an "official" standard...

> What do we want??? Another Microslut, telling us "This is the standard or
> go screw yourself!" or what?

If you want a open standard then ditch MagiC and run MiNT. Do you know
any other GEM/TOS-compatible OS with free source?

> Can't say that for the Atari stuff: one programmer sez' "don't care about
> MagiC users", the other one sez' "forget about Mint", as a USER I say:
> "who da fuck are you to set standards? Let the user decide!"

How can we program for MagiC when all the docs are in German? (If
anybody can get me the english programming-docs I've been hearing
about for a couple of years now but never seen I'll stand corrected.)

> Perhaps MagiC and Mint/NAES should come together and create a super OS for
> Atari, with all the programmers following the same line.

This happens all the time, lots of MagiC-features has been implemented
in MiNT and vice versa.

4517. Re: Pacifist-Disk-Images to AtariST

Newsgroup: comp.sys.atari.st
Date: 1998-12-15 00:00:00 UTC
From: Andy Blakely <andy.blakely@pnl.gov>
Message-ID: <3676E8C2.336B4BAD@pnl.gov>
Source record: 88284

I'm having the same problem. I've tried several programs that claimed to transfer *.ST disk images from PC to ST. MakeDisk seemed to be the best choice, but the "/auto" extension didn't work for me. After trying different combinations of tracks and sectors, I finally found a configuration that worked, but I got errors each time I tried executing a program.

The only way I could get disks to work between the PC & ST was to recycle some 720kb disks that originally had IBM compatible programs on 'em. But what about images larger than 720k?

Is there a program that can convert *.ST images back into working Atari files -- on the PC side? Then I could just copy the files onto Atari compatible disks.

Also, does anybody have the game "Phantasie II"? My data disk got destroyed, and I need a copy (preferably in Atari format).

Thanks,
Andy Blakely

Parcel force don't know the meaning of being careful. I have had a lot
of problems with them. If you remember a year ago on Watchdog, they
did a report on the carelessness of Parcel Force.

If you are so sure that Steve is a 'conman', then why not use your
REAL NAME, instead of hiding behind an anonymous tag. I know a few
people who have delt with Steve, and all have NOT had any problems.
Steve is a very honest and decent bloke.

This sounds very much like you are trying to run a one-man hate
campain against Steve.

It's quite easy. Just goto http://st2disk.atari.org and download
st2disk. This program runs on a real atari and allows you to put .ST
images onto real atari disks.

Hope that helps!

Try downloading CAF2.06 from Steinberg, but keep the CBX-D5 drivers where
they are now. Or rather where they were when you had a version that ran ok.
If necessary use an old version of mros from when everything was ok.

Atari standard is mint with multitos, it is all documented.
atari corp way was to go the MiNT way. Just that the corp collapsed at the
wrong time.

>
> We've seen what the results were, haven't we?
Considering that Multitos is/was the standard, Magic is supposed to
intergrate mint features, which does pretty closely, and all in all, works
rather well. Some VERY interesting people like Julian Reschke always do
Magic AND mint, always considering both alternative.

>
> So, next came MagiC, and perhaps they've set things to their own liking.
>
> Another one is Mint/NAES, who did exactly the same.
MiNT/Naes works is the closest implementation to TOS.
Some people might say, no, magic is closer, more compatible, yet most
software that work in singletos don't work in magic, or in a weird way.
Example? my prog, they all find their RSC file fine. But obviously you
have problems with those programs, I wonder why, magic or mint shouldn;t
make a difference. But the root here is singletos, so to me it makes sense
that if in SINGLETOS it works (rsc thing) and in MiNT also, well there is
a prob with magic. Which I am sure could be fixed in newer version, or
maybe a bad setting of your magic setup? Anyway, I run MiNT, it is the
atari set standard, (was), I do program that will work for MiNT. Since all
the calls I use are documented, they should work with magic as expected.
Though, don't expect Singletos to perfectly work, as Singletos is just
lacking too many options/calls. How about Photoshop in MS-DOS 4.0 ?

I don't think you will blame it on Photoshop itself, but more on the fact
that it is NOT written for MS-DOS. Quite logical to me.

There was NEVER a good copatibility with atari, and actually I have to say
that the compatibility has GREATLY increased since few years.. Going
better and better..
Imagine, many games, demo, Word processor only worked with 1 version of
TOS. Not working with another etc. Example?
Cubase score with TOS 2.05, or, "Le redacteur" with TOS 1.6 and other TOS
version, etc. NOT even talking about FASTRAM, or VIDEO (svga) or
Multitasking!, Just plain singletos can't run those program depending the
atari you had.
Over the years, we have a much better compatibility, flexibility, more
consideration of the OS, more documented calls etc..

>
> Listen, I'm a user, and I don't run 2 OS-es. (Well, mainly I run MagiC,
> and if that's not working OK, I run TOS).
That's a choice. every programer is a USER also.
Just that if you code a little bit, you might see that the OS you use is
VERY important, and sad to say, but most magic users only like it because
of the look and the 3d icons color, and the background windows in JINNEE
desktop. Or maybe the illusion of the speed in magic gained over MiNT.
If you have a 520St, no doubt, magic will perform much better.
But well, in 1998, soon 1999, still using a 520St as your main platform
and expect full support ? I find that odd.
Yet, some people have Hades with 060, blazzingly fast, but no decent OS to
run. That means, going to Linux. Which in this case a cheap pentium would
have been a clever choice.

>
> What do we want??? Another Microslut, telling us "This is the standard or
> go screw yourself!" or what?
Atari corp did it.. All the calls, standard are defined. IF a new OS comes
up and decide to not stick to those calls, oh well, what can you do?
I know what I did, I don't use it.

>
> Do we want an about died platform to continue into two different
> directions or do we want a platform to go on to serve users?
Users should chose what OS they want. As long as there is 50% of people
using magic and 50% using MiNT, well, expect programs to be parsed the
same way..

>
> I'm about to test Linux on this machine, and I'm glad at least Linux heads
> one way...
hehehehheeh, not quite. You'll be quite surprised!.

>
> Can't say that for the Atari stuff: one programmer sez' "don't care about
> MagiC users", the other one sez' "forget about Mint", as a USER I say:

> "who da fuck are you to set standards? Let the user decide!"
But the users still didn't decide which way to go. That's the prob.
People wondering between singletos, MiNT and magic..

>
> Perhaps MagiC and Mint/NAES should come together and create a super OS for
> Atari, with all the programmers following the same line.
MiNT tries as much as possible to stick to magic, And magic the same..
But it is not close enough still.. Getting there though.

MiNT Is Now TOS, Let's move on, shall we?

4527. Re: Questions (2) about drives

Thanks for comments/help.. (especially impressive, I think, that Nicholas responds so often here and at the toad board on top of his work on the FAQ)

On Tue, 15 Dec 1998, Nicholas Bales wrote:

> It sounds like the second drive isn't recognized. Does AHDI see it when
> booting up ? If not, it might just be a cable problem.

As you'll see below, I've pretty much ruled out cables as source of problem, and I still need help and clarification of suggestions emailed by someone else privately:

> Have you tried accessing them with only one drive connected at a time, if
> you can access both of them in this way then to would prove that both the
> drives are working correctly and that it is a connetion/driver software
> problem.

I have tried each seperately and the one just doesn't seem to be there. I have used cables that have been proven to work on the working drive...

> Presumably you are using some kind of HD Driver software, you could try
> re-installing it, this might solve the problem.

If I re-install a version of AHDI as suggested, will it entail re-formating or some other certain loss of whatever may still be held on the drive? (Luckily nothing too vital)

And (question showing my relative ignorance) how do I boot (re-boot) my mega st4 with just ahdi so I can see more clearly what it sees and doesn't (as per nick's suggestion above)???

Thanks also Nicholas for the clarification of my options for the syquest. What does everyone recommend for a scsi adaptor? I have dealt with ICD before and don't relish the looooooong wait/no contact but I guess they are the source...

|
|Then I suggest you try again! I downloaded the TOS version a couple a
|days ago, and it is version 7!

You are right. I made the mistake of not reloading the site and kept seeing pap6tos and not pap7tos. Once I found it I treid for some days to download it but the transfer kept stalling after anything from 5000 some odd bytes to 1200000 bytes. I overhauled my HS-Modem setup and finally got it. I don't know if the site was very busy or if I had something not quite right in the Auto folder.

I hope that HiSoft do decide to stay with Papyrus 7 as long as the release of the English version is not held up and as long as a proper UK English dictionary comes with it (in the UK naturally). The Americans will want a proper American English dictionary.

Well, possibly :-)

MP> I'm changing my ISP from Demon to Zetnet, and I've got STiK running on
MP> the Zetnet account (VERY slow, though) but I'm having *incredible*
MP> difficulty sorting out Oasis 1.35 :o(

I'm using STinG, (POP+NEWS)watch and Okami, but I'd guess the
important thing is NOS mode which Oasis 1 and Okami share :-)

MP> I've tried the Zetnet support website, but now everything's just in a
MP> helluva mess (lucky I still had this old Oasis 2 setup !).
MP> Has anyone managed to get a (standard) 14 meg Falcon running
MP> STiNG/CAB/POPWATCH and Oasis 1.35 (all in single TOS) in harmony with
MP> Zetnet ?

Well, not me - I'm using a Veloce+STe and MagiC, and it works in
harmony (until the other day - upgraded to MagiC 6 <g>), but a lot of
the details are similar...

MP> If they have, would they be kind enough to advise me, or better still, mail
MP> me copies of their Startup.Nos, Dial.Txt, etc. file to me, please ?
MP>
MP> If anyone can help, they'd *really* be saving my sanity :o)

We can't have you going mad ;-)

Couple of points - I gather Oasis 2/ICE is 'problematic' with Zetnet,
although you can use Oasis 2 with (POP+NEWS)watch.

Plus, I'd go for Okami instead of Oasis, as it's currently supported,
and really, really good :-)

But, if you have your heart set on Oasis 1, we'll have to see what we
can do... ;-)

MP> Thanks in (hopeful) anticipation,

Feel free to mail me for further help (BTW, have you subscribed to
zetnet-atarians mail list?) :-)

4535. TT Floppy Drive

Newsgroup: comp.sys.atari.st
Date: 1998-12-15 00:00:00 UTC
From: mlake@melake.erols.com
Message-ID: <slrn77bmgu.49r.mlake@melake.erols.com>
Source record: 88339

The floppy drive in my TT seems on its last legs. I want to replace it but I know nothing about these things. What do I look for in a floppy drive that will work in the TT? Is replacing the drive something that I can do easily?

TIA.

Oliver,

I tried it too, from MagiC, e-mailed Kath about the "not found RSC", so
Kath sez "I prefer Mint/TOS compatible programs", well, that's OK with me
too.
So I gave it a shot from TOS, still running the card in TC, I get a black
dialogue box too, fill in one JPG and give the dest GIF a name, next click
the continuously flickering "do it!" or whatever box a click, but it's a
nogo! The "quit" box worked OK, though...
BTW, I used the DJPEG ttp that came with Jpegem.

Guess that leaves me using the switches on the cmd-line, running from
MagiC, but it works...

I beleive that I am right in saying that TT's and Falcons use 1.44MB PC
floppy drives and therefore any current PC drive should solve your problem.
As I don't own a TT I am not sure of the way the drive is fitted into the
case but I would have thought that I be a straight exchange, just unplug the
old drive and replace it with the new one.

Check out the Quick FAQ.

A PC drive will do, but try to find one with jumpers for configuration.
If not, you will have to do a bit of soldering.

> that library =:->).
No lib, I control everything I do.

This is the best example of having 2 standards.
Leads to crap, error, bugs.

This is what happens/ed:

In all my Shareware, I don;'t know if you've noticed, but i use always 2
rsc for the standard and for magic aes.
Take a look at popgem for example, released months ago, always 2 RSC
files, named *2.rsc for magic.
JPEGEM was supposed originally to work with both as standard using the
same technique.
The program went on and on, but magic got tossed out of my computer, NO
more magic..
Also, the calls I used in jpegem were more MiNT specific, so I deceided to
not bother with the magic compatibility as 80% of chance it would not
work.
So, checking for the cookie magix was not needed anymore, then when
finished, I totally forgot that it still look for the rsc2 if magx cookie
detected..
Such method just proves how complicated it should NOT be.
Last point, I do not having magic, and have no idea how it works with
jpegem, Boris told me it works very well, but someone here said that with
the rsc2 trick, it crashed still. So, where to look? Should I take a look?
As far as the RSC not loading, I used to be a die hard magic user, And
sorry to announce that to the world, but it seems that it was NOT rare at
all that programs couldn't find their inf files and RSC. Obviously I was
the only one having this problem.

>
> Anyway: The program itself crashes - no wonder since it uses MiNT only
> calls as Kathrine said.
There you go, Weird that boris (telnetvt102 author) said that it worked
fine with his magic and his TT.

> And I think that it would be really disgusting to claim that (quoting from
> JPEGEM.DOC) "JPEGEM will work in MiNT, as it was developed under it. It
> >>>might<<< work under magic, no idea really..", because Kathrine should

> know that it *can't* run.
1) why quite disgusting?
2) I claimed already that it might not work under magic, so don't say I didn't warn.
3) I don't have no betatester for a freeware.
4) jpegem is a simple pexec, THAT easy, all the important work is done by djpeg.ttp. I wonder why such a SIMPLE project as a stupid shell wasn't done before.
5) "because kathrine should know it can't run?" no.. How the hell could I know? I don't have magic anymore... The only way to know is YOU users, telling me it doesn't work.. I looked for it, I saw the routine, cookie checking, I fixed it, I am waiting for a decent edited RSC, then released that as version 1.1. What's wrong with all that?

> *But*, as I mentioned before, I hope (and think) that Kathrine uses a
> crappy GfA library (IMHO most of them are really bad in a manner of
Sorry to disapoint you, everything here is handled by me directly, no lib what so ever.

1) the RSC part is always shitty when coding. different aes, different OS, different color depths etc. Magic doesn't help at all. I do NOT want to use a lib for c_icons.
2) sometimes people forget the real meaning of the word freeware, I am sure half of the programs you have, you didn't pay for them and expect the same quality from PD. You (not 'you' personally) should take a look back, and analize the general tools we have for atari.

Calamus SL, not GEM, colors are weird. Crashes weirdly.
Cubase, too TOS depandent, not GEM either, not multitasking happy.
Newsie, no comment, will eat harddrives FAT, will crash, hang etc etc.
Magic, No comment.. Imagine the word "bug".
Popwatch.. No comment.. I started popgem.. I think it explains it all.
GEMtrade, this one is a joke to me, supposedly ruftrade but clean GEM interface, even for freeware I don't want it.. tried it, I laughed to hard. Then I saw that GEMtrade is distributed by system for tomorrow? or another company.. What a blast I had..

I could write a FULL LENGHTY list of such programs, that some people seem to live with.
Did I ever complained/bitched about POpwatch not working like it should? No, it makes some users happy, The goal of such program is obtained. Nothing to add..

PS: Nothing personal with the authors.

Everyday I have to live with some program that bluntly don't want to work with mint. Following the ASH way of seeing the future of Atari, accepting the Wdialog crap, their stack, their own way of handling calls already declared by Multitos "official from atari corp mind you"

Magic is the best, most flexible, blah blah, yeah right, yet I am quite laughing when I see that you guys still are looking for a decent email

program, or ICQ program, or even ftp.
It's been years that MiNT had PP, but of course ASH claimed that mintnet was only slip. (smells like microsoft if you ask me).
AV-protocol is a new thing for you, installing a * to a text viewer scares the shit out of you.

Yes, claiming the falcon crashes with magic is because of the bad architecture of it. Well, sorry to announce that, but My megaste also must be VERY bad.. Coz it crashes exactly the same. And yes, I did try a lot, all the patches, (or seemed like patches), that didn't help a whole lot. GEMDOS fatal error, destroyed FAT etc. Multitasking slow as hell when you do a file access, no prioritization, no unix sockets that ARE a standard by nature. even win98 with winsock can deal with it!.
No, ASH had to come up with something better than such a scheme.
Refusing what atari corp had installed, and been revealed that it was a good idea/implementation , to me is not atari anymore, but magic. Magic will run evidently SOME atari applications, but it stays there.
Where are the english doc for magic coding? This could have helped a little. Besides, most funny thing:
Most magic dudes move platform, to mac or pc.
Is it due to the fact that they are reassured that magicmac/magicpc will still be there? If yes, do you really think they will invest into atari specific things? like shareware? or new hardware? This whole emulator thing is another thread I guess...

Or is it that they got fed up with the lack of smooth OS, apparently seen as the best?
if the best can't get them enough, well I don't know what can..
But the thing is that "Magic being the best" is just wrong.
Some people still imagine mint os as being a TEXT command line with a weird filesystem needed for it to work. Hence loosing all their harddrive files coz they need to reformat it etc. That's all rubbish.

It's been now 3 years I have been a mint user, everyday, average 10h/day. My friend have some PII 450Mhz. I have NO need, NO wish to switch over, coz all I see is win98. And yes, it is quite an adventure.. No thanks, home computing is NOT win98 to me. I like to know what's going on on my machine, I like to have no restraints, I like it stable, flexible etc.

Last time I used magic, sorry to say that, but it was quite sad. Nice interface, it looked snappier (noticed the "LOOKED", only an impression)
The prob is lack of interesting application, lack of interaction with the multiple applications at the same time, I felt like I couldn't breathe. Not knowing if the text I am editing will be saved on time because magic would have crashed before doing so.
Not knowing if I execute a beta, I will have to reboot right after, and run a disk doctor to see if the FAT was messed up...

Yes, I am NOT a magic fan, I used to be.
Yes I love MiNT, and shoot me for doing software for my prefered OS.
MiNT doesn't cost a dime, is updated more often, you can even see the source yourself to make some changes, update or debug it if needed.

That's the same kind of spirit that linux has. Nothing to hide. Sharing is all what's about.
In magic, for a simple ascii > html, boom shareware 30 bucks..
(hypothetically speaking).

Ask ASH to propose a MiNTnet port for magic, called like magicnet. This will already help a LOT.
Ask magic to support minix and extf2 filesystems. They are the deciders, you'll see what they're gonna answer.

Magic is an OS you paid for. Yet I don't think you get treated the way you should be.

Anyway, a lot of rambling, probably what I said is 100% or 80% bullshit, but I DO think what I said. At least that's 1 opinion. I might be the only one, and it doesn't matter. At least you know my position about magic/atari in general. I DO NOT want to start any war.
It is all personally, it is all you computer, your hobby, your money. Place it wherever you wish. Whatever choice you do, you live with it, you deal with it.

Yes, well blown, but the 2 lead in fuses and the mains voltage breakers
didn't and neither did the one in the hard drive so I assumed it was the
main lead. Nothing else was effected, neither the computer nor the
monitor and these are all on the same circuit although individually
fused of course.

It might be worth running an overall check though, I have a friend who
is a fully qualified electrician with all the gear.

Thanks,

Trevor

Fnoradel is great. It's free, it's a room based bbs, and it networks with other Citadel programs on nearly every platform. It can run on floppies, and it could take only a few minutes to set up. Users can create their own room, public or private, and has doorway capability for online games or other utilites.

Fnordadel is a descendant of STadel, which is a descendant of Citadel. Source code is free and available, which is why it exists on nearly every platform.

Two questions:

1) Why would one work and not the other?
2) Why not upload the damn thing?

Ok, a third question:

Speaking of sound, the voltage that comes out of the RCA jacks, is
that for audio input of an amp, or direct speaker connections?

Hmmm, I'm a little confused here. I have used MiNT, N-AES and Geneva on
my Hades and there is a Hades port of Magic available (although currently
only in German). So, a Hades can run as many OS's as other Atari's.

Regards,

Ben Hills.

It does. In Thing one has to find and install one's own utility to actually
do the printing. There are several but none will take a plain binary file
and print it via GDOS that I know of.

Which works well, having set up another account (with freeserve).

You have to remember to click on "default config" in CAB's proxy setting box
to pick up the new settings, otherwise it'll carry on using those set in
default.cfg.

Hi Katherine,

In Magic, jpegem looks for a JPEGEM2.RSC !! If you rename JPGEM.RSC to
JPEGEM2.RSC, it will work.

Christopher,

there's dozens of apps being able to display JPG's. Personally I have a
favour for Graftool, being fast, giving nice output and being able to
convert into other formats.
There are lotsa shareware/commercial packages for playing around with them.
Recently we've been discussing DJPEG and CJPEG ttp's, DJPEG for converting
JPG into GIF and CJPEG for the other way around.
Graftool is memory-hungry, but it works OK on a 2 Meg system. Check out at
http://ourworld.compuserve.com/homepages/JJvB/
It's a bit limited unregistered, but registration should only take an
email to Joergen.
BTW: it's been more than a year since the last update, I wonder if Joergen
still works on it?

Been thinking about Mint/NAES for a while, I must admit. The other option
was to upgrade to MagiC 6, but I've been postponing that for some time.

ATM I'm not able to anything at all, got no more HD space and I'm just
waiting for this 1 gig drive to come back. Wanted to test Linux from that
one but perhaps I should skip that one to avoid even more problems and
start putting up Mint and the whole bunch on that one.

"Hey son, what computer you got?"

"Atari, sir, 10 years old..."

"Aw, Pacmanmachines eh? Can they run regular stuff then?"

"They used to be able running from DD floppies once, but now you need
5 gig drives to accomodate 3 OS-es, in order to stay compatible"

You're dead right Kath, let's move on... :-)

Hi all,

I have an interesting problem with Okami.When I collect my mail with Popwatch it collects my mail ok.I receive quite a few attached files so I import all my mail into Okami only to find I can't unpack large binary files.

I have a box come up with UUE ERROR or something like that and thats it.When I check the original mail the beginning part which is the Table of attached mail seems to have disappeared rendering the binary useless.

Has anyone else had this problem?

I was wondering whether that will the attached file is being unpacked it get written to the TMP directory.If so,It could be me running out of disk space so Okami can't complete the operation.

I look forward to your comments...

Thanks

Gordy.....

Gordy,

AFAIK Okami unpacks into the main dir, O or whatever on your system.
If that one's got limited space, you might experience those troubles.
Check your free diskspace on O's partition, move it to another one with
more space available, whatever.

Hello Martin,

t> Well, under MiNT it works just great. Why should she bother to get the
Oh, that isn't correct! Even with MiNT it works not on every (standard)
resolution (although there is no reason for this behavior) and it doesn't

work on (at least) so strange colour-depths like monochrome or 4 colours
(again there is absolutly no need for this).

t> shell working on MagiC? MiNT in combination with N.AES is the OS of the
? Why not?

The number of Atari interested people gets smaller and smaller. And I
think,
it is no shame to program in a "compatible GEM style" ;-)

Indeed, there is *no* need to program just for MagiC, but a well
programmed
GEM style program has to run on every TOS compatible system (maybe unless
it
really has to use some OS specific features, but a/that shell doesn't
need
to - and finding the correct position of the RSC file is at least not a
problem, even on MagiC ;-)).

Note: It should not be understand as a sort of "destructive criticism", it

was intended as a "little hint" for "thinkful" programming to make as much

people happy as possible (*without* really lot of work - at least, good
programming saves always time in the end) with a program on a platform,
which
number of users gets smaller and smaller!! :-o

t> further not that very buggy MagiC.
(haha) Yes, that's a point for you! Sometimes I wake up in the morning,
mumbling into my cushion "at least, today I have to install MiNT getting
rid
of my MagiC, because it is a lot faster and not buggy at all"! >;->

In former times I only used MiNT and MultiAES, really hating MagiC. But it
is
fast, relieable and gets the hell out of my hardware! ;-)

PS: I think, a guy with the mail name "tos4ever" should understand such
thoughts, or not? ;-)

4560. Re: [FREWWARE] jpegem

Newsgroup: comp.sys.atari.st
Date: 1998-12-16 00:00:00 UTC
From: Oliver_Schildmann@LU.maus.de
Message-ID: <199812160000.a21202@lu.maus.de>
Source record: 88216

Hello Katherine,

k> SingleTOS doesn't know about half the calls I do in jpegem.
Thats OK.

k> For magic, and it's RSC not found, well, sorry can't help it there
either,
k> but jpegem is NOT the only program reporting that it didn't find its
RSC
k> in magic. As you've noticed, in MiNT and SINGLETOS it DID find its RSC,
so
k> my guess is that magic here is somewhat not 100% compatible. But well.
no
But there are many programs written in times when MagiC and MiNT,
MultiAES/
N.AES/... doesn't exist. But: Even today they can find their RSC files. So

sure there is something different, but that should make no difference! :)

I really could draw dialogues with Line-A on the monochrome ST screen (and
it
works, even with MiNT), but it is not a reason to say "it's fine and if it

doesn't work, it is a problem of the users OS or settings - he just have
to
change" =;-)

If I`m not able to avoid it without investing much additional work, OK!!!
But
I dont`t think that this is the point at that shell (see below).

BTW: Maybe you can send my the RSC routine and I take a look what's wrong?

k> further comments on magic.
Comments are always welcome :-)

k> Magic users IF they really want to use such a tool just can use the
TTP.
k> It will work as well, if not better than the GEM shell.
That's not really my intention. My intention is: "Programm in a `clean`
way
in a world which gets smaller and smaller". Or, to mention a song of
"Beloved": "Let's come together, right now, oh yeah, in sweet harmony" ;-)

k> 3) I did this tool as a freeware, because It is a tool made for myself
AND
k> that I don't use magic anymore. so I can't waste my time trying to find

k> some fix for magic users..
I sure understand that! :-)) (although, I try to fix my programs to run even
on the different emulators).

On the other hand: Even today it is in my opinion not a shame to program "GEM
compatible", using - *if possible* - an old, backwards compatible function if
the preferred new one is not available.

k> SINGLETOS won't work, don't even try, as it even use some calls to see if
k> the child process is done/exited or not.. Which of course, SINGLETOS
k> doesn't know at all, too old..
Yes, but on the other hand: If the child process is done on SingleTOS, the

parent *really* knows!!! Or what would you think? =;-))

I can't believe that a "Does run MiNT? If not, do a single pexec!" (nothing
more, nothing less) can put an actual programmer in big trouble or confusion
(especially if she/he is used to program threads ;-)).

But if so (what I really do not think - at least in your case ;-)), I could
post GfA code how to check it, just to insert it into your GfA listing of

JPEGEM.

k> Magic, I don't know how it handles pexec 100, and check for child
k> processes.
1. Not at all (it uses SHELL_WRITE for threading and messages for checking).

2. At the end of a thread the creator gets the message THR_EXIT:

word[0] = THR_EXIT (88)
word[3] = AES id of finished thread
word[4,5] = <errcode> (LONG!!!)

(or look at U:\PROC\)

But why should you do that for a hobby program? I totally agree, (hobby)
programming should solve own problems and/or just make fun! :-))

But if you insert a simple pexec for SingleTOS, it even would run with MagiC
(not as good as with MiNT, but it would probably work without any additional
work at all - except the RSC problem of course ;-)).

k> Black dialogs? well you know if your AES doesn't support
k> C_ICONS, there are 2 ways.
I tried it with MultiAES 4.x, ...

k> OR second is to use COLOR_TT patch. Which patches the AES of your TT
k> (there is a version for older aes too!) to support c_icons, just like
on
k> newer aes.
... so there is no need for COLOR_TT.

And I really see *no need* to be incomatible even with the last existing
original Atari multitasking OS.

Amazingly enough, if I use 16 or 256 colours, it works just fine!!!!!! But

not on systems with less colours (and maybe not on systems with more
colours).

I have learned that a proper GEM program should run regardless of
resolution
(OK, maybe not in low-res if splitting up a dialogue results in a lot more

work) and colour-depth.

If a software runs with 16/256 colours and not with 2/4/TC (and just uses
RSC
dialogues), you *can`t* blame *any* OS I suppose, it's just up to you.

And to be honest: The programs name is "JPEGEM.PRG" not
"JPEGMiNTwiththeEnvironmentIsupposetobetheBest.PRG" ;-)))

When I saw "GEM shell" I thought to download a proper GEM program (which
works - having your warnings in mind - at least proper with MiNT).

k> there you go, magic users and singletos users can use that.. Nothing to
be
It's old, it's (very) big, it's just not invented for only that purpose.
:)

I just screwed up my already existing shell (a "generic", multi-function
one)
to solve a problem I had (just like you ;-)).

Such small, fast programs are always welcome!! ;-)

My opinion: Every programmer can learn from (nearly) every new program
(one
thing that makes programming IMHO so interesting :-)). And if I am able
to
program in a clean way, even on the platform I prefer for my own there are

maybe less errors to correct in the future. ;-)

k> mad about. Sorry if I use some MiNT calls in my program, but it just
k> happens that there are MANY MiNT users out there, and half the power of
it

But is it really that much "more work" for you to add a simple SingleTOS routine? It is *just* a pexec of the DJPEG.TTP, just displaying the dialogue
again if DJPEG has finished, ready to get the next filename.

No "voodoo" there, I suppose ;-)

But I have to admit: *Sometimes* I think, some programmers use MiNT/MaciC

only functions (and not some additional SingleTOS functions) just to say "Hey, you, out there! Use MiNT/MagiC/(insert personally preferred system here
;-)), it's much better and I know what's good for you!". :-/

k> restrictions. If CAB for example doesn't use threads/forks it is because
k> of the singletos users, and magic users. So still waiting for CAB to
k> display a picture or formatting, when it could do something else more
k> useful.
If the programmer is able or willing to use some modern functions, it is no
problem to get the information whether it is possible or not. ;-)

And as I mentioned earlier: MagiC has threads (and signals, but no forks).

In fact, the MagiC doc says (translated, but I can't say anything about it's
correctness):

MiNT doesn't know Threads. The functions named in the MiNT source as Threads
creates an own process, just in the same memory.
The Threads of MagiC are built after the concept of Sun Solaris 2.x.

Anyway: Even if the concept is a better one, I would extremly prefer an overall compatible concept though!! =:-))

k> MiNT is Now TOS. Let's move on, shall we?
Of course! :-)))

But (and that's directed to all programmers) as an ending word to explain

what my intention is: If there is really no need, don't forget the other users - PLEEEEAAAASE! ;-) You help to keep the small Atari world alive
...

Greetings, Oliver

Hi Louis. Hmm, I can't think of anything that is made just for Magic that I miss on my Mint setup. On the other hand, I've heard that quite a few apps/games won't work with MagiC. Everything that I've got that ran under my singleTOS setup, works with Mint also. Some Eurodemos won't work from Mint, but you know how demos are-they won't work with a lot of setups, and just holding down the <shift> key at bootup gives you the option of by-passing Mint, and loading singleTOS.

Lets look at opportunities for a moment. With MagiC, you can run MagiC specific apps (like Icon), and TOS software that will work under MagiC, right?

Well, with Mint, you can run Mint software, most TOS software, -AND- Unix software that is ported over. For example, we Mint users have ICQ (micq). This is just one example of many.

Well, its just a thought or two of mine. See ya later! ;-)

Graftool is great indeed. Personally I don't use it very much but on the
few occassions I do use it I'm always taken by the speed of Graftool.
Above all it's for free. The only thing you must do is send a regstration
email to the author. The unregistrated version is limited. I though one
can't convert to for instance *.gif.

>BTW: it's been more than a year since the last update, I wonder if Joergen
>still works on it?

I don't know.

There is also Imagecopy (my preference) but this is a commercial program.
For more info about Imagecopy take a look at http://www.cix.co.uk/~sta/

Gemview is another shareware package that can be used.
A very good new shareware prg is Vision. This is a French package. AFAIK
the docs aren't translated yet but the program itself is in English.

There is also a small cpx called apexjpeg with which you can convert jpg
into gif, targa and ppm. I don't know where you can find it but if someone
is interested let me know and I'll send it to you.

Ofcourse there is also 1stguide, looknsee and not to forget Cab.
I probably forgot a few others.

To find the URL's of all the prg's listed above just go to the UTSI pages,
see my sign off.

1stguide can be found on the utility accessories link
looknsee: uitlity/divers link
Vision, Graftool, smurfdemo: graphic link
Gemview: ftp//193.190.205.13/atari/Draw-Graph_Tools/Gemview

Hope this help

My opinion indeed.
Sorry I didn't wanted to sound so rude. I guess I had a bad day yesterday.
I still think however that MagiC isn't that good because it can't be used
on the modern clones. Yes, I know it runs on the Hades but you need a
special version. Milan? Forget for the moment. Is that the definition of a
good OS?
MiNT however runs AFAIK on every machine be it a modest 1040 or a Hades
060/Milan.

My 2 cents

Hi Ronald,

let me put it this way: I am glad I've got MagiC here, although not the very latest version. The regular stuff operates very decent with it, to be honest, sometimes I run for weeks without resetting. Only some oldies refuse to go with it. Knowing them, I switch to TOS for these. Also some new stuff I sometimes like to try (Vision is an example) won't run too well, and sometimes it just does OK. Since I've got MagiC, I basically won't go without MT. OTOH, I'd like to experiment. Had thoughts about Linux, the problem is it is NOT compatible, it is said to be rocksolid, but then again, for just experimenting it mite be a bit too much trouble. Then there's the division already when I should go further than the basic stuff.
At the same time I loose one gig drive just to Linux. The other option was NetBSD, but that's about the same. Third option was Mint. Advantage is the compatibility.
Have some Q's already, I think the docs are not strictly clear on it:
I gathered Mint is started from a regular Atari partition, then uses it's own partition as c, correct? How about all the other stuff? Are the other drives accessible as well?
The minix partition will be put on a new 1 gig drive, which will get drive letter L on my system (maybe L, M and N, or L and M). I've got my MagiC setup on my C, another one without Magic on D, the F drive has a starter for the old systems (no GFX card). I'm preparing partition "I" here for a Mint config, so booting mint should work pressing I. That would later become pressing L, or am I wrong? Anyway, have a lot of reading to do yet...

AIXIT boards use the presence detect pin on SIMMs to set the size. Since not all SIMM mfrs. follow this "ISO Standard" convention, you may have to alter the pd pins on the SIMM to fit the spec.

that simple...

Martin,

Graftool converts into GIF alrite. Not into JPG. One great advantage is
that you can convert into TC PNG while running in 4 bit or 8 bit mode.
Disadvantage is that it eats RAM. Load 8 bigger JPG's and you know what I
mean. I had one 780 kb JPG the other day when I "only had" 4 Mb ST and 16
TT RAM, it wasn't enough to display the piccie :-(

>Gemview is another shareware package that can be used.
>A very good new shareware prg is Vision. This is a French package. AFAIK
>the docs aren't translated yet but the program itself is in English.

My opinion is "slightly unstable under MagiC"... it seems to be a nice
one, though. Just another update announced yesterday. BTW, Vision goes
into the picture editor section, whereas Graftool mainly is a viewer.
>
>Ofcourse there is also 1stguide, looknsee and not to forget Cab.
>I probably forgot a few others.

Does CAB convert? And 1stGuide, didn't that one support JPG? Or maybe I'm
wrong again.... :-)

Want more names? Digital Lab (french too, shareware, editor tools)
Smurf (german, shareware, editor tools)
Papillon (german, commercial, editor tools)

And, let's not forget Johan's MGIF: perhaps the fastest JPG displayer
around, especially on mono screens PHANTASTIC output, converts to GIF.
(OK folks, I'm not talking about DSP/Falcon converters)

I even like it on my card, where it displays 4 images next to each other,
but the quality is perfect, in greyscales.

Martin,

well, I had a bad mood too yesterday evening, hence the posting.
First of, it was a stupid matter of renaming the RSC file, and after that
it worked, and it worked OK at that! But I got a bit p....d, because Kath
said "it works on Mint, so that's it". Alrite, you can opt for that, on
the other hand, it's not all Mint users over here. Look at the Attack
guys, they come up with 2 versions for their programs, one for MagiC, one
for Mint. OTOH, you mite say this is ridiculous. Why not go to one
standard and one standard only? Indeed, I agree that ASH is walking the MS
path and I don't like it either. Well, time will tell, but I'm gonna (try
at least) putting Mint up on this machine. Using 3 OS-es, my Gawd, and I
have been laughing about those DOS/Win suckers :-)

PS: seen the latest posting by Kath, announcing a Magic version??? :-))))

Aloha!

John, I can't speak for the older boards. Mine is the latest one, which
takes FPM and EDO.
Perhaps it's a matter of jumper configuration. Might also be you have
wrong SIMMs for it (asymmetrical types). The latest version also warns for
3.3 Volt types, these don't always work.

I have one piece of 64 Mb EDO in bank 0 and it works flawlessly.

Here's from the docs for my board:

16 Mb simms, ID xx1740x are OK
ID xx1640x are not OK
ID xx6516x are OK
ID xx6416x are not OK

32 Mb simms, ID xx1740x are OK
ID xx1640x are not OK
ID xx6516x are OK
ID xx6416x are not OK

64 Mb simms, ID xx6540x are OK (I'm using one of these)
ID xx6440x are not OK

128Mb simms, ID xx6540x are OK
ID xx6440x are not OK

If the ID shows a V somewhere in the middle, these are 3,3 Volt ones.
Siemens IC's that have a HYB31 ident are 3,3 Volt types too.

Another thing is, on old TT's with a CPU daughterboard, you need to jumper
one switch for a wait-cycle.

Additionally, when using different sized modules, the bigger one goes into
bank 0, the smaller one into bank 1. That's for my version, again.

HTH,

4585. Re: [FREWWARE] jpegem

Newsgroup: comp.sys.atari.st
Date: 1998-12-16 00:00:00 UTC
From: Oliver_Schildmann@LU.maus.de
Message-ID: <199812160000.a22044@lu.maus.de>
Source record: 88241

Hello Jochen,

j> In Magic, jpegem looks for a JPEGEM2.RSC !! If you rename JPGEM.RSC to
j> JPEGEM2.RSC, it will work.
Indeed, unbelievable, it works!

But that is impossible an error of MagiC itself - looks like a way to
"discredit" that OS I suppose (not by Kathrine though, maybe she is using
a
sort of crappy library - and maybe it is not an error, but a "feature" of

that library =:->).

Anyway: The program itself crashes - no wonder since it uses MiNT only
calls
as Kathrine said.

PAUSE

A few tests later: JPEGEM looks out for the MagiC cookie ("MagX"). If it
founds that cookie, it searches for JPEGEM2.RSC, if not, it looks for
JPEGEM.RSC.

So this "MagiC error" has nothing to do with MagiC. Even if you set an
empty
"MagX" cookie under Kathrines own MiNT/N.AES environment, it won't run!
:-(((

And I think that it would be really disgusting to claim that (quoting from

JPEGEM.DOC) "JPEGEM will work in MiNT, as it was developed under it. It
>>>might<<< work under magic, no idea really..", because Kathrine should
know
that it *can't* run. The best is done to let the user think that MagiC is
a
quite stupid and incompatible OS which can't stand the easiest task like
loading a RSC file. :-(((

But, as I mentioned before, I hope (and think) that Kathrine uses a
crappy
GfA library (IMHO most of them are really bad in a manner of "proper GEM
programming") and she even doesn't know exactly what the init part of the

library does.

Of course: I really want to know what library she is using! Kathrine?

Greetings, Oliver

We are Microsoft - Resistance is futile!

Hello Terry,

o> Do you have any plans to write a shell for jpegtran, too? That would
o> be cool. I find it by far the most useful tool of that package.
(loading) ... (reading) ... *Yes!* ;-))

That is really a nice tool!! Changing all JPEGs with the help of an GEM
dialogue could be a nice shell job :-)))

With the previous mentioned XINFO (German freeware, although the
documentaion
says something else) you can just add the following line to the
configuration
file by example:

UJPG=JPEGTRAN.TTP|-progressive $NAME$EXT $FSEL'Target
File:'$REDIR'NUL:'$STOP$QUIT|-> Progressive JPEG

Dragging a JPEG to the program you get a button "-> Progressive JPEG".
Clicking it, XINFO asks for the destination name, starts JPEGTRAN for the
job
"-progressive" (kicking the output to the NUL: device), stops to show the

return value and quits.

But because you can just add one complex commandline function per file
type
(hmm, I have to think that over I suppose ;-)), a small batch file would
do
the job much better (at least if you can handle the destination name
easy).

But be sure, if I add a special JPEGTRAN dialogue to the program I give a

call ;-) Although, even if I make it, it will take time!

So anyone who is willing to program a small JPEGTRAN shell, should make it

(and give here a call, I'm also very interested ;-))!

PS: If you are really interested in XINFO, use FTP-Search and look out for

the latest official version (1.00ß, 29.5.1994). Mail me if you have
problems
to get an unofficial new version. At least if I find the missing resource

definition files (:-/), there will be a new English version (also if not,
but
that would cost much more time ...).

MiNT boots from your boot-drive, just like MagiC. All partitions are
available under MiNT, including DOS- and VFAT-partitions. You can also
install minixfs and use Minix-partitions (highly recommended).

> The minix partition will be put on a new 1 gig drive, which will get drive
> letter L on my system (maybe L, M and N, or L and M). I've got my MagiC

> yet...

Having separate partitions for each system sounds complicated for me,
I boot everything (TOS, MiNT and MagiC) from c:\. It's just a matter
of using a decent boot-selector :-)

My setup is C (TOS) for booting and system-utilities (MiNT kernel,
device-drivers, filesystems, N.AES, MagiC, accessories, GEMSYS etc.),
D (TOS) for software-development (I have lots of old but useful stuff
that chokes on long filenames and/or case-sensitive filesystems), E
(VFAT) for apps and their data, F (minixfs) for most of the unix-stuff
(/etc, /var, /bin, /usr, /tmp), G (minixfs) for user-directories, H
(TOS) is a big partition for various stuff, I is my Zip-drive and J
(minixfs) is an old SCSI-drive that's shared between my Falcon and TT.

As you can see most of this stuff (except the minixfs-partitions) is
common for TOS, MiNT/N.AES and MagiC, and if you just want to run
GEM-programs then the difference between N.AES and MagiC is minimal
(except that N.AES is a lot more stable on my Falcon).

As you can see I also have MagiC (v5.something), but rarely use it
since there's nothing I can't use MiNT/N.AES for. I only have one (1)
application that needs MagiC, and that's ASH Emailer. But what the
heck, it looks a bit cool but is really crap compared to pine under
MiNT...

But if I boot MagiC there's a lot of things I can't do anymore: No NFS
so I can't share disks between the TT, Falcon and PC. No printerserver
so my TT and PC can't print anything. No decent shell (tcsh), no
decent internet-apps except CAB, no virtual consoles, no decent

terminal-emulator...

MagiC looks pretty good and has many cool features, but the lack of more advanced networking and no easy way to run the unix-apps I'm so used to it's not an alternative for me. MagiC is a very fine AES-environment, but MiNT is so much more...

Newsie may have problems with WDIALOG, but I'm not talking about editing
them, only about sending a mail that has a nickname as the receiver. This
is the action that crashes POPWatch.

> WDIALOG and Newsie seem to have some difficulties as far as these
>functions are concerned. Dont know why...
>Try disabling WDIALOG or dont use nicknames until these problems are solved ;)

Since I don't use WDIALOG, and editing nicknames doesn't cause any bombs,
disabling it won't make any difference.

As to not using nicknames, I don't. I'm using Okami, as you can see in the
headers for this article, and haven't had any problems sending to multiple
addresses. <FX: fingers crossed>

Hello Jo,

j> Basically MiNT will run on any machine that runs TOS, that includes
j> many of the free/shareware emulators as well.
Yes, basically. :)

j> Ofcourse, but these already exists in TOS. They're not perfect, but it
j> makes MiNT highly compatible and easy to port. The reason why MagiC
Ah, I see, same mechanism as Windows on DOS I suppose ;->

He come on, that was just a joke :-)

j> This is a myth! Run MagiC (or NVDI) through a reassembler and have a
j> look at all the compiler-generated code in there... Practical
Of course. I didn't wrote, that it is written in assembler!

j> benchmarks also shows that MagiC isn't "incredible fast" compared to
j> MiNT or TOS. It can *feel* faster though, because it dynamically
j> assigns almost every CPU-cycle to the top application. Imagine what
j> that does to background-processes...
Sure, on an actual workstation I have much time to spend to processes I
don't
use at that time. But we talk about outdated Motorolas.

And I talk about ordinary users wich want to use word processing and
databases, maybe opening a browser inbetween without closing their actual

work, not number crunching in the background, playing a sort of DOOM game
in
the front =;->. If you study computing or need a really good machine for
computing, than you are changed to i.e. PC and Linux long ago. OK, there
are
some "hardcore freaks" which only uses Atari, but how many?

Compared to actual (or not even that actual) hardware, any
Atari/Hades/Milan
is incredible slow. So "move on" is reality, but that means most of the
times, "move on to another system" :-/

j> Another myth, "MiNT is slow". This is pure BS,
? Did I wrote that? Nonsense! I wrote "OS"! MiNT is just part of an proper

Atari OS (and not that "slow" either I think). :->

j> But and only shows how little you know about it.
And your statements show, how academic a computing freak can think,
ignoring
the reality as long as it is possible and the mass of not-freaky users

too.

The CPU doesn't get faster, so extracting an archive or decompressing a JPEG
is just as slow as it is. But if your word processor can react a little bit
slower, if the windows are drawn faster or, or, or, and the application is,
because of that, able to do some more work in the back- or foreground, *that*
is the point of interest for most of the users.

OK, you blamed me, I blamed you, we both blamed us, is it good though? Shall
we go on or change to something more productive?

I think, we can just blow away our heads, but the Atari market won't come to
any former prosperity. It is over! We can just make ourself and the rest of
the existing users such a good day as possible ...

Greetings, Oliver

Let's see it run TOS 1.62 then :P

BTW, I do agree about the Hades, if magic had been made properly in the
first place you wouldn't need to get a "special" version of it.

And I know what the response will be, "the new version will take advantage
of the extra hardware" but that goes for the other OS's anyway which run on
it already.

AM.

I think therefore I AM.

Martin, good thing to know.
>>
>What about Speed of the Light and Stella?

Yup. SOL is no longer supported and I honestly don't know whether or not
you can still register the last version (3.8)... Otherwise you're stuck
with a very limited app.

Stella is OK, tho' I don't consider it a viewer, nor a piccie editor.
You can do different things with it however and the catalogue functions
are OK (erm, don't forget Graftool does that too).

Let's not forget the guy originally asked for a viewer for an ST2, I
reckon he's on an SM124 or so, therefore I suggest MGIF, for the best mono
output (I remember I used MGIF the very first time on my SM124, I thought
it was "photo-quality" :-)!. If he runs color, I'd say SOL or Graftool.
Very close in output.
The advantage of Graftool is it can handle many formats as compared to SOL
or MGIF.

4592. Falcon stereo problem pt. 3

Newsgroup: comp.sys.atari.st
Date: 1998-12-17 00:00:00 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <367981A4.3BF3@primenet.com>
Source record: 87998

I just wasted my whole afternoon tinkering with my audio out jack on my Falcon. I still get no sound from the right channel, unless I turn the gain all the way up to the right channel, and all the way down on the left channel, and scream into the microphone, and even then I have a feeling I am getting bleedover from the left channel, it is very garbled.

I tried booting with no hard drive hooked up whatsoever and playing a stereo game from floppy, still no right channel. I can't vind a VRAM setting, at least not with the program bootcfg, that has anything to do with sound. I have tried a million speakers, it's not that.

I tried opening up the case and inspecting the jack from the inside, everything looks fine.

Is it possible for one channel to just "go out" on a Falcon, and if so can I fix it somehow, get a new soundchip, or whatever, or even send it somewhere to get fixed, or will I have to shell out $500 for a new Falcon to have stereo again?

I am in Washington state. Please help me, I would really appreciate it. Thanks. -Satcom2

Hello Al!!

Man, we've missed ya. I don't know if you remember me, but I've bought a monitor and a used copy of Laser C from you as well as some other stuff awhile back. I still use all the things Atari I've bought from you over the years. I've been wondering what you have been up to these past few months. I'm glad to hear that your mom is better and that you're enjoying Florida.

I would love to see the Computer Dungeon open once again. I can't tell you if it would be worth your time finacially, but I can tell you that you would have at least one steady customer. ;-)

Best of luck, and let me know what your plans are.

Thanks,
Leslie

Update (on those items I can intelligently comment on):
>
> Cab - Crystal Atari Browswer. For all STs?
Yes, although it should be noted that many web pages are assuming 640 pixel width.

> Stik - "ST Internet Kit" - a TCP/IP stack that handles only SLIP
> protocols. If it is only a stack, why is it called a "kit"?
> For all STs?
Frankly, few use STiK nowadays, but it does run on all STs.

> STinG - TCP/IP stack that handles PPP protocols. For all STs?
Yes.

> MiNT - multitasking program. Kernal? I am under the impression
> that MiNT adds to TOS and doesn't completely replace it. Someone
> said it replaces GEMDOS? For all STs?

I'm a bit vague on this, but MiNT is basically the multitasking kernal for TOS. It is not the only one -- I use Geneva, which is commercial. When MiNT first came out, it was slow enough to be laughable, but continuous improvements have made it the current choice of many. It's for all STs.

> FreeMint - The latest new generation of MiNT. For all STs?

MiNT used to be freely distributable, but then Atari hired the author and made the software commercial. FreeMint is the one that is currently being worked on, and as described, is free. It's for all STs.

> Newsie - Is this really a Newgroup reader that handles email as well
> as FTP? Does this mean it works for WWW? For all ST's?
Yes. Beware, though... Some swear by it, some at it.

> TAF - Toronto Atari Federation - computer user group?
Yes, based in Toronto, Canada.

> What or who is ADH? Are FIFFI, ADH, and ASH interrelated?
ADH was a typo. ASH is Applications Systems Heidlburg (I may have misspelled it). They are the company that put out the software programs FIFFI and ASH Emailer.

> N.AES - a new AES replacement - only works with MiNT?
N.AES isn't new any longer. It is a solid replacement for the built-in AES. I think it requires MiNT, but I'm not 100% sure.

> Thing - DEsktop replacement.
Yes -- it's widely considered one of the best. I've gotten sort of used to NeoDesk, though, which is commercial.

> Nemesis - A Falcon h/w + s/w accellerator, graphics enhancer kit.

Not quite. Nemesis is a overclocker that runs your entire Falcon about 150% of its previous speed. This increase in the data bus is enough to make 640x480x16bit graphics run at a useful refresh speed. The Videl chip could always do 640x480x16bit, but the 16Mhz bus would have mandated an eye-destroying flickering 40Hz screen. With the bus at 25Mhz, about 60Hz refresh is possible.

> NOSTalgia - ?

A shareware program for the PowerMac that emulates the ST. With my 225Mhz 603e, speed is acceptable, but frankly the inability to read floppy/hard disks directly is a major pain. I'm leaning towards MagicMac, which is commercial and expensive.

Galen (Head YACcer, Yolo Atari Club)

>
> Update:
>
> Cab - Crystal Atari Browswer. For all STs?

Yes, though forget it with less than 1 meg and it's tight in less than 2.
Older versions need less RAM.

> Stik - "ST Internet Kit" - a TCP/IP stack that handles only SLIP
> protocols. If it is only a stack, why is it called a "kit"?

Not sure of the story behind the name, but it was initially issued in a
package with an early version of CAB/CAB.OVL, the first native GEM
graphical browser.

> For all STs?

Yes.

> STinG - TCP/IP stack that handles PPP protocols. For all STs?

Yes, but very old ones might have trouble due to buggy OS (TOS 1.0).

> Gluestik - A translation layer which lets you use STik/STinG
> clients with MiNTnet. I don't understand why Stik/STinG wouldn't
> work without this.

They do. However as STiK/StinG interface with clients in a different way,
if you want to connect with MiNTnet you need the translation layer to use
STiK/STinG *clients*: the combination of MiNTnet/GlueSTiK *replaces*
STiK/STinG. MiNTnet has a lot more choice in the client department due to
ported Unix stuff and MiNTnet native apps.

> Again, for all STs?

Yup. But only those with enough RAM to run MiNT/MiNTnet/GlueSTiK and have
memory left for apps. Realistically 4 megs or more, I guess.

> MiNT - multitasking program. Kernal? I am under the impression
> that MiNT adds to TOS and doesn't completely replace it. Someone
> said it replaces GEMDOS? For all STs?

Not sure about the technicalities, but it runs on all STs, RAM permitting.

> FreeMint - The latest new generation of MiNT. For all STs?
>
> MintNet - Net extensions for MiNT. For all STs?

Yes, RAM permitting.

> Minix - another OS. Completely unrelated to TOS or GEM? For all STs?

It's a Unix variant, so no relation except the file system. Don't know
minimum hardware requirements.

> MinixFS - The Minix File System (only for MiNT)? Not TOS compatible?
> for all STs?

Not TOS compatible in that TOS doesn't understand it, you need MiNT to use
the relevant drivers. Will run on anything which can run MiNT.

> aFTP - "Atack" FTP. For all ST's?

Yes: two versions, one native MiNTnet, one STiK/STinG.

> DuFTP - Data Uncertain FTP. All STs?

Yup, but MiNTnet only.

> Newsie - Is this really a Newgroup reader that handles email as well
> as FTP?

Yes.

> Does this mean it works for WWW?

It includes a basic text browser, other wise use CAB.

> For all ST's?

Yes, RAM permitting, though beware nasty bugs.

> FIFFI - An ADH FTP program.
> ASH Emailer is the email program.
> What or who is ADH?

A typo! It's ASH.

> Are FIFFI, ADH, and ASH interrelated?

ASH are a software publisher, who (amongst other things) market MagiC,
NVDI, CAB and their own TCP/IP stack called I-connect, which isn't
compatible with either STiK/STinG or MiNTnet. CAB works with any of the
three stacks due to alternative CAB.OVLs. I-connect has its own suite of
net clients: Fiffi is the FTP client, ASHemailer is mail/news, there is a
telnet program too. All of these are commercial, with the possible
exception of the telnet client.

> PPPkit - Everything you need to get on the internet. Obsolete?
> Forget it? MiNT needed? Allows you to use portions of
> MintNet without installing a Minix file system?

That was the general idea, but most MiNTnet clients need Minixfs and a
unix-like directory structure to function, so without it you were
restricted, unless you installed Gluestik too. Once STinG came on the scene

with PPP support, PPPkit lost its raison d'etre (STiK is SLIP only): you
either went the STinG route or installed full-blown MiNTnet.

> Oasis - Newsgroup reader with email? (Now unsupported)

Yup. Oasis 1 was OK but a little non-standard. Oasis 2 was something of a
debacle. Okami is a much better bet, IMHO.

> N.AES - a new AES replacement - only works with MiNT?

Yup.

> NOSTalgia - ?

ST emulator for Mac, I think.

Hi, I just ported micq latest few days ago.
It is version 0.3.2, under the name micq981213_mint.tgz
I put on some ftp. Don't remember which though. Should appear in few days.

What you need is MiNT, MiNTnet , a working connection, and a shell, or an
aes with toswin if you want to have fonts, and colors.
But colors can be disabled..
if you guys don't find micq latest, I will put it on my page.
Since it is just a port, I don't think it has the right to be on my page.
bye./

BTW my UIN is: 16180769

hello
I am looking at upgrading the serial port on my nephews STe.
I am not sure if I should go with RS Speed/RSVE or the 38000bps
(which looks easier). One problem I have is with the GAL chip?
Do I have to program this? Where do I get one (BeST?) Can they be
purchased pre programmed? Everything else with the installation looks
very straightforward.
thanks for any help
ken

Yes, FloppyShop and LAPD went under, and it is sad
(though I've heard someone will b taking over LAPD)
btw, have you thought of taking over Floppyshops incredible 7 set
CD-ROM collection?? I am not suggesting that you go into the PD
setup, but just add the CD's to your existing line.
I think both LAPD and Floppyshop were struggling NOT with the Atari market
but with the internet. Since now most people can get to test out
all the shareware they need on the internet, the reason for a PD
library has disappeared. I know TAF has had miserable sales from its disk
library, as everyone can get the stuff from the net.
witness the number of peole asking how to transfer Atari software
from MACs and IBMs!
glad to hear you are OK
ST+Fanzine is doing quite well!
watch for AC#12!
see ya

Hi friends: I have a question. I just got at a local computer
store a new 1.44 megs NEC IDE drive. It looks just like the original
Falcon. When I connect it the same way as the old one the lights don't
come on. If I connect the ribon cable inversed then the Falcon willl show
A and B drives but would not read. When I connect the old one it works
partially.

Any ideas?

Thank you.

Hi Martin,- then I must have done something wrong.
I did DL the demo of Calamus 98 and the Bridge 3 module, and put the
Bridge module in the module folder. But when I try to export a Gem picture
Calamus was looking for something else, not a module with the CXM extender.

I`m not used to Calamus, that`s why I figure I must have done something wrong?

4608. ScreenBlaster II upgrade

Newsgroup: comp.sys.atari.st
Date: 1998-12-17 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <759jq8$js2$1@dbtsvr2.dbtech.net>
Source record: 88148

I bought new the ScreenBlaster II hardware/software for the Falcon. And it works fine. Although I find setting up new resolutions a bit hard with the software.

Was wondering if there where any upgrades to the software other than version 2.00?

Also, I found a screen blaster info file for use with the hardware on a ftp site awhile back. This had a lot of resolutions already set up. I have lost that .inf file and have not been able to locate it. Anyone know if it is on a ftp site? Or has a similar .inf file with lots of resolutions already set up for a SVHS monitor that they could e-mail to me?

Thanks for any help with this,
phantomm@kih.net

So that button has a use after all! Having only one account and using STinG
for that I'd given up on that particular dialog in CAB in terms of making a
difference (as the proxies worked whether showing in the dialog or not).
Makes sense if CAB is running before you dial out. What happens if you
don't have any proxy settings in DEFAULT.CFG at all?

Update:

XHDI compliant - Extended Hard Drive Interface. Is it a interface
Standard? By who?

Cab - Crystal Atari Browswer. For all STs?

Stik - "ST Internet Kit" - a TCP/IP stack that handles only SLIP
protocols. If it is only a stack, why is it called a "kit"?
For all STs?

STinG - TCP/IP stack that handles PPP protocols. For all STs?

Gluestik - A translation layer which lets you use STik/STinG
clients with MiNTnet. I don't understand why Stik/STinG wouldn't
work without this. Again, for all STs?

MiNT - multitasking program. Kernal? I am under the impression
that MiNT adds to TOS and doesn't completely replace it. Someone
said it replaces GEMDOS? For all STs?

FreeMint - The latest new generation of MiNT. For all STs?

MintNet - Net extensions for MiNT. For all STs?

Minix - another OS. Completely unrelated to TOS or GEM? For all STs?

MinixFS - The Minix File System (only for MiNT)? Not TOS compatible?
for all STs?

aFTP - "Atack" FTP. For all ST's?

DuFTP - Data Uncertain FTP. All STs?

Newsie - Is this really a Newgroup reader that handles email as well
as FTP? Does this mean it works for WWW? For all ST's?

TAF - Toronto Atari Federation - computer user group?

FIFFI - An ADH FTP program.
ASH Emailer is the email program.
What or who is ADH? Are FIFFI, ADH, and ASH interrelated?

PPPkit - Everything you need to get on the internet. Obsolete?
Forget it? MiNT needed? Allows you to use portions of
MintNet without installing a Minix file system?

Oasis - Newsgroup reader with email? (Now unsupported)

N.AES - a new AES replacement - only works with MiNT?

Thing - DEsktop replacement.
MT-Newswatcher - Newsreader?
Nemesis - A Falcon h/w + s/w accellerator, graphics enhancer kit.
NOSTalgia - ?

Continued additions and corrections would be greatfull.

4614. Epyx Art & Film Director .FLM files

Newsgroup: comp.sys.atari.st

Does anyone out there have any experience with Epyx Art & Film Director?
It was my favorite art and animation program for the 1040STf. The
Film Director program saves animation files under the .FLM extension
but I'm beginning to suspect that it's a different format from the
usual .FLM format.

Does anyone know for certain if Epyx Film Director .FLM files are the
same as the standard .FLM files?

Hello Martin,

t> on the modern clones. Yes, I know it runs on the Hades but you need a
t> special version. Milan? Forget for the moment. Is that the definition
of a
t> good OS?
? The OS doesn't have to run on every machine without any changes (in
fact,
that is impossible unless you make the hardware *absolute* compatible and

just look at a Wintel PC to see, how bad this is).

The *applications* have to run on every OS regardless which machine!!!!!!

t> MiNT however runs AFAIK on every machine be it a modest 1040 or a Hades
t> 060/Milan.
Without any changes? I suppose the changes are just already in the source

code and you can tell the compiler by parameter which version should be
compiled.

At least, BIOS and XBIOS - the very deep core of an OS - have to be
hardware
dependent.

But of course, if you just use C, changes are quite easy, you just have to

use the appropriate library for the target system and maybe make some fine

tuning. But MagiC has large parts in assembler (which makes it so
incredible
fast) so the changes are more difficult.

So keeping in mind, that even the new clones are not the fastest number
crunchers of the world (honestly, they are really slow compared to *any*
actual non Atari hardware) you have to decide: Use a slow OS on a slow
computer (but with Unix compatibility) or use a fast OS which makes the
computer more faster to work with (but "just" with TOS/GEM compatibility).

Both arguments are very well in my opinion!! :-))

Stick AHDI in the Auto folder on a floppy disk, or just run it
seperately. It searches for available drives and lists them. If it fails
to see one of the drives, I would say that it has probably died.

>
> Thanks also Nicholas for the clarification of my options for the syquest.

Seeing that you are in the US, the ICD seems to be the only way to go.
Maybe you can buy it from another dealer though.

Mike,

both cjpeg.ttp and djpeg.ttp are oldies. They could be used to convert GIF into JPG (Compress into JPG/CJPEG) or convert JPG into GIF (Decompress JPG/DJPEG).
Lotsa options, using greyscale or color output, set the compression factor, handle Targa files, selecting RLE output to name just a few.
Trouble was, they had so many options, I always sat with the manual in my lap operating them.

They have been revised several times, and now Kellis has written a "shell" for DJPEG, which sets the switches in a nice little display.
So instead of calling DJPEG and typing
"-g -q16 -1 k:\images\picture1.jpg f:\other\images\picture1.gif"
you start the program and select by means of the fsel and set the options thru' buttons.

DJPEG is part of the package available at
http://www.esc.de/homes/guivol/jpeg-bin/jpg6btos.zip
which contains both cjpeg, djpeg and jpegtran, a package to "fix" jpg's and do other stuff. One version of DJPEG comes with Jpegem.

well... there is a *huge* difference between 4 weeks and 4 months.

> >4 months without my TT ..... *sigh*
> >
> Erm, I've got an original Atari board filled with 16 megs (yes I know;
> *only* 16 megs!) idling around here... interested?

Maybe.... then again, I already paid a fortune for that first board;
I would expect Aixit to provide suitable support and respond within
a _reasonable_ delay, if they intend on staying in business....

Besides, I'm becoming _very_ tired of investing so much money into this
TT, because the hardware part is somewhat outdated, especially on the
networking and graphics side.

It has to be said that the AixTT was already overpriced; at 1300 FIM, it
comes out 4 to 6 times the price of a single 32 MB SIMM. Basically, the
card costs more than any amount of RAM you could put on it.

Therefore, I damn well expect Aixit to support my investment into their
product and replace my broken card, WIHTIN A REASONABLE DELAY.

Because of the inexcusably long delay (it _has_ been 4 months already),
they really should compensate by sending me a sample of their brand-new
256 MB version, instead of whichever flaky old prototype of the 64 MB
they still have on hand...

They should also replace the 2 SIMMs their defective 64 MB card
has broken. Those have costed me a fortune, but their product
damaged them.

Point is, they should provide basic support. 4 months of waiting
for a replacement that never comes is not any good business' way
of handling things.....

4622. Re: GEM (was: [FREWWARE] jpegem)

Newsgroup: comp.sys.atari.st
Date: 1998-12-17 00:00:00 UTC
From: Martin-Eric Racine <q-funk@hal.fishpool.com>
Message-ID: <Pine.LNX.3.96.981217131927.5131A-100000@hal.fishpool.com>
Source record: 88162

After reading the thread about apparent defaults in Kellis' shell
for jpeg tools, plus her replies about those, here are my thoughts:

1) proper GEM programming

Obviously, there are various ways to see this.

One poster's point was to do whatever it takes to make the RSC work
on any system. Nice in theory, except making 2 separate resources to
cover for people who don't use AES 4.x (Magic, N.AES, etc.) is becoming
a waste of time.

Someone _has_ to upgrade AES at one point, if they intend on staying
on Atari. AES 4.1 (MultiTOS) can be found on some FTP sites or one
can also purchase Magic or N.AES, but anyways, SingleTOS _is_ gone;
this has to be clearly understood by everyone; support for older AES
cannot be expected anymore; we _have_ to move on.

2) programming choices (threads, etc.)

The same poster showed an exerpt from MagiC programming docs that
said MiNT doesn't have threads. Then again, another ASH product
also states that I-Connect is the only TCP/IP stack that provides
PPP capabilities, even though MiNTnet has been supporting PPP since
Jesus was born, so......

Basically, docs of any ASH products have recently shown a BillGates
style of propaganda, so I tend to disregard them.

Now, about programming choices:

there is _no_ standard way of programming for multitasking or new
AES versions anymore, because MagiC deviates too much from the
Atari-approved MiNT/MultiTOS specifications.

Therefore, even though they both use a unified U: drive, their
methods differ too much; this means one has to make a choice when
programming and outside Germany, the choice has been MiNT.

Then again, even the Milan uses MiNT+N.AES+Thing, so maybe it says
something about what _is_ the de-facto standard, nowadays.

NOTE: Magic certainly shines on other aspects (more contemporary
looking AES, usable on 4 Mb or less, etc.), but the fact
that it was never upgraded to support Atari-approved ways
(ie: MiNT, MultiTOS) suggests it _is_ the one to blame for
shrinking portability of GEM software....

Martin, I thoroughly disagree. I use an Atari for Cubase. Cubase does not work under any multi-tasking operating system available for the platform. Its rock solid timing is infact because it runs under singetos. The other apps that I use are all related to sample editing, manipulation and transfer to external devices. It is an annoyance that I have to shut down Cubase to use another application but it would be even more irritating if I had to do a cold reboot into Magic or MultiTOS just to use these other apps and just for the dubious advantages of a multi-tasking environment.

Have you ever seen MultiTOS run on an STe? It's pathetic ... 2-3 seconds to open a window etc etc. I've tried installing Magic (a friend's copy, I had every intention of buying it if I liked it) it wouldn't recognise my hard drive (one of the very first external SCSIs available for ST range). Buy a new hard drive and HD Driver just to run Magic, nah don't think so!

I don't think that is the de-facto standard on the TOS platform. This is surely still a 1 meg STFM with TOS 1.4 or upwards?

Is there a program to convert standard MIDI files to Music Studio files?
There are quite a few to do the opposite (MS .SNG -> .MID) but I need
something to go .MID -> MS .SNG.

Any help would be greatly appreciated. Additionally, if anyone know of
a site where there are Music Studio .SNG files to download, please let
me know. It seems there were lots and lots of these in the BBS days,
but sources seem to have dried up lately.

Thanks in advance for all replies,

Randy Kwak

I have a 1040STF with hard drive for sale. It comes with two track
ball modified mice and one extra atari mouse (unused). It also comes
with two external drives and has both color and mono monitors. With
that is bout 250 lbs of software books and a Hewlett Packard Black Ink
Jet printer which I will include as well.
I will not break up the set and I am asking $250 for the whole lot.
Picked up or delivered to you within 250 miles of Cleveland, Oh.

Please E-mail CFIPAUL@worldnet.att.net if you are interested.

Thanks!

one option you may want to consider would be using BSS' Videlity
program, as it also supports hardware like Screenblaster and BlowUp. I
believe Titan has a demo of this on their web site.

Strange, cause I seem to remember reading that it does, but then
I cannot remember which OS it sucessfully runs on. There must be
a FAQ....?

> [the standard] is surely still a 1 meg STFM with TOS 1.4 or upwards?

Nope. Something 020 (or better) with either MagiC or MiNT+N.AES is.

> > this has to be clearly understood by everyone; support for older AES
> > cannot be expected anymore; we _have_ to move on.

If all you use your Atari for is music, then yes, Steinberg's own
M-ROS is probably all you need.

However, modern software with colour icons and multi-tasking means
upgrading your AES. Sure, miracles still happen, but you cannot
expect a single-tasking OS in monochrome to provide you with a 3-D
GUI, flexible networking, nor extensive programming facilities.

Let's face it:
anything below TOS 2.** is outdated for any serious work,
in a real-world situation.

M > 1) Why would one work and not the other?

How would I know? As someone else pointed out, the one that doesn't work is dated _later_ than the one that does. The one that works came on an Atari system disk for one of these TTs here. The later one came with the xcontrol1.31 distribution, IIRC. Maybe someone else can explain why Atari replaced a cpx that works with one that doesn't?

M > 2) Why not upload the damn thing?

This is a text group, not for binaries.

Heck, I thought most everybody had this cpx. If not, please tell me how I can upload to comp.sys.atari.binaries via email, as my bbs/provider carries only a couple of newsgroups. I am pretty sure it can be done - keep the instructions simple (for simple minds). Or maybe I should upload to some other place?

have you ever seen Linux & X11 run on a PC 386SX20 ? :)
The hardware must also move on !

It's a pity that very good old software don't run well with MiNT/NaAES, but
it shouldn't be a reason to deny what _is_ the future : multitasking.

|> I don't think that is the de-facto standard on the TOS platform. This is
|> surely still a 1 meg STFM with TOS 1.4 or upwards?

I agree with you, I still use an old 1040STf for Cubase, but I the only thing
I hope is that a very good (and very cheap ;)) sequencer will run on my Falcon
and MiNT.

We must move on ! :)

> that is impossible unless you make the hardware *absolute* compatible and

Why is it so? MiNT relies on TOS' bios/xbios, so there's very little
hardware-dependent code in MiNT itself. IIRC there's only some
MFP-code and perhaps the clock which handles the hardware directly.
Basically MiNT will run on any machine that runs TOS, that includes
many of the free/shareware emulators as well.

> t> MiNT however runs AFAIK on every machine be it a modest 1040 or a Hades
> t> 060/Milan.
> Without any changes? I suppose the changes are just already in the source
> code and you can tell the compiler by parameter which version should be
> compiled.

That's correct, MiNT has been modified for the new clones. Since the
source is freely available it didn't take long either...

> At least, BIOS and XBIOS - the very deep core of an OS - have to be
> hardware dependent.

Ofcourse, but these already exists in TOS. They're not perfect, but it
makes MiNT highly compatible and easy to port. The reason why MagiC
doesn't work on the Milan (and why it took ages before it was ported
to the Hades) is that ASH has to rewrite large parts of the (x)bios,
and being a commercial company they won't do that until there's a
certain userbase. AFAIK was MagiC ported/fixed to the Hades by a
competent user, and not ASH themselves.

> tuning. But MagiC has large parts in assembler (which makes it so
> incredible
> fast) so the changes are more difficult.

This is a myth! Run MagiC (or NVDI) through a reassembler and have a
look at all the compiler-generated code in there... Practical
benchmarks also shows that MagiC isn't "incredible fast" compared to
MiNT or TOS. It can *feel* faster though, because it dynamically
assigns almost every CPU-cycle to the top application. Imagine what
that does to background-processes...

> actual non Atari hardware) you have to decide: Use a slow OS on a slow
> computer (but with Unix compatibility) or use a fast OS which makes the
> computer more faster to work with (but "just" with TOS/GEM compatibility).

Another myth, "MiNT is slow". This is pure BS, and only shows how
little you know about it.

4637. Hello From Computer Dungeon!

Newsgroup: comp.sys.atari.st
Date: 1998-12-17 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <19981217131331.07307.00000507@ng-cf1.aol.com>
Source record: 88177

Hello to Everyone!

First, a quick update:
After operating The Computer Dungeon in Berkeley, Illinois for over a year, jobs & family dictated that we move to sunny Tampa Florida. Making a cross-country move involved a LOT more work than I ever dreamed and I sometimes felt that we would never get settled in. Then, in addition, my mom has been very sick and underwent surgery twice (including a hip replacement) that resulted in my being away from home alot. So, between the two events, I lost all contact with the world of Atari.

But things are much better now. We've settled into our new home and are loving it. Have much to get used to, though; for example this is the first time in my life where I've had to swat mosquito's while hanging Christmas decorations outside!
And my Mom is feeling much better and getting around pretty good, even though slow with her cane/walker.

So overall, we have a LOT to be Thankfull for this holiday season and life looks pretty good.

Today:
What happens with The Computer Dungeon? At this point I'm not sure; maybe reopen or maybe just a "Garage Sale" on remaining inventory. Feedback would be appreciated.

As I said, though, over the past few months I've lost all touch with anything Atari (though I did use my STacy while away from home to write letters, figure expenses, etc.) and was wondering if anyone would care to fill me in on whats been going on? What new software/hardware items have been released? How are Atari Computing and ST Fanzine doing? In general, how is the Atari marketplace doing (I've heard that two Atari retailers have closed, Floppy Shop and L.A.P.D., which saddens me)? Any Atari users located here in Tampa, Florida?

Any general info anyone can pass on, either through this newsgroup or by Email (ComDungeon@aol.com) would be greatly appreciated.

Lastly, I'd like to Thank everyone who has supported Atari products over the years; from the retailers, developers, and Shareware authors to everyone who has used and is still using an Atari computer or video game system; from those that run Atari websites and BBS's to those that publish magazines - fanzines - or newsletters. Atari users are the best!!

From all of us here in Florida, may you enjoy the best and safest of Holiday seasons!

Al Horton,
The Computer Dungeon

4640. Floppyshop Closing Down On 30/01/99

Newsgroup: comp.sys.atari.st
Date: 1998-12-17 00:00:00 UTC
From: Steve Delaney <floppyshop@cyberstrider.org>
Message-ID: <75bmsfmrv1@news1.cableinet.co.uk>
Source record: 88180

****
PRESS RELEASE: Floppyshop, Aberdeen
5th December 1998 Floppyshop To Close Down After Nearly 12 Years
****

It is with deep regret that we announce the closure of Floppyshop on 30th January 1999. Despite tremendous support from a small section of our customer base, it became apparent that we simply lacked enough 'active' customers for us to continue providing a service as we head towards the Millenium. Before we go, we'd like to give something back to our loyal customers, some of whom have been with us from the beginning. With this in mind, we are holding a Closing Down Sale until 30th January 1999. All customers on our regular Internet mailing list should be receiving details of this within the next day or two unless they have already done so. Full details will also appear on our WWW site at http://www.floppyshop.cyberstrider.org where we're currently having a huge "Virtual Christmas Party"! It will be on-line from about 3am GMT on Monday 7th December.

Open letters to the Atari community can also be found on the site. In these we give our thanks to our many friends made over the past 12 years. We also pay tribute to those who continue to fly the flag and set out our thoughts for the long term future (and there is a definite future) of the Atari community. Fellow Atari dealers are most welcome to contact us with regard to taking over our CD-ROM compilations and/or commercial products, should they wish to do so. We will be contactable by email. post and telephone until mid-February.

As not everyone on this mailing list is a customer or even an Atari owner, we will not bore you with the whole story. Suffice to say, if you are not on the catalogue mailing list and are interested, check out the Web site. Journalists in particular are encouraged to do so, as it is not our intention to suddenly vanish without trace, and any mention (feel free to reprint both messages in their entirety if you¹ve got space to fill) in your respective publications would be very much appreciated.

We would like to thank both our customers and friends (many of you fall into both categories), for their support over the years. Just one more thing, Atari computers are not affected by the Millenium Bug, so enjoy the Millenium while those around you crash!

In conclusion, it is very likely this will be the final message sent out on the ³Floppyshop News² mailing list. Goodbye and good luck for the future.

Regards

Steve Delaney and Irene Lamb

Hello Katherine,

k> Anyway, a lot of rambling, probably what I said is 100% or 80%
bullshit,
k> but I DO think what I said. At least that's 1 opinion. I might be the
only
Nobody will take you your opinion (at least not me). If you read my
posting
about MiNT/MagiC on different hardware, you see that I'm not a friend of
"system wars"! :-)).

k> one, and it doesn't matter. At least you know my position about
k> magic/atari in general. I DO NOT want to start any war.
Me too.

But you can understand? Programming software which is explicitly prevented

from running under a special OS, "faking" an error which doesn't exist
sound
very "microsoftish" to me (as thats exactly how M$ kicked DR out of the

market!). Especially if the programmer has to know it better (you can be
sure
- even in my biggest software I know what my personal library does,
because I
programmed it line by line).

Anyway: I *do* believe you that it was just a fault and not a way to
discredit a system/company you don't like. But I don't want to hear in the

future, that MagiC is even not able to find RSC files. =;-)

A system war is the *last* thing the Atarians need (and even if I can't
follow your criticism on MagiC itself in most of the points, I can really

understand your opinion on the behavior of ASH, as they seem(!) to "split"

the Atari market (although on the other hand, it's fantastic to use the
well
knowned Atari software not even on Ataris, but on best Mac and Wintel
hardware - sure, every medal has its two sides).

Anyway, my intention don't have changed. I think only together we are
strong
and even if it's freeware, if a user is helped by a little more piece of
code, then I make it. But that's one opinion, I don't really blame others
for
other opinions. ;-))

But if there are any problems (and I know, especially with GfA you can
have
lot of trouble) I'm sure there are Atarians here willing to help ...

So just one thing left to say:

Live long and prosper ;-), Oliver

We are Microsoft - Resistance is futile!

4643. mICQ

Newsgroup: comp.sys.atari.st
Date: 1998-12-17 00:00:00 UTC
From: gokmase@my-dejanews.com
Message-ID: <75bt7jctn1@nnrp1.dejanews.com>
Source record: 88183

Greetings Atarians!

I wonder if somebody knows what is needed to run mICQ.
MiNT + any AES or what?

Where can I find the binaries for download?`

Thanks in advance,

Joakim

(MiNT is now TOS-compatible) :)

I sold an FA-8 for $200 some time ago.. it's worth a
little less now.. my guess is the FDI is worth a bit
less then that. I'd say $125 for the FDI and maybe
$150 for the FA-8. All of the Falcon stuff is pretty
affordable used now.. see my system in a previous post.

Wrong, Cubase works with MiNT/N.AES. I saw it with my own eyes.

Try the latest one. My experience with the previous version wasn't good
either but the latest one seems to be more stable.
In case you've troubles to get on the webpage (IMHO very slow) you can
find it on the Belgium ftp-site
193.190.205.13 atari/incoming/graphics/vision35.zip
>
>
>Does CAB convert?
No, it doesn't but it can display,
And 1stGuide, didn't that one support JPG?

1stguide supports JPG very well indeed

>Want more names? Digital Lab (french too, shareware, editor tools)
Nice one

>Smurf (german, shareware, editor tools)

Very nice

>Papillon (german, commercial, editor tools)

Photoline (German, commercial, editor tools)
Piccolo (French, shareware)

It even supports animated gifs. Very nice indeed. The major drawback is
that Papillon 3.01 needs NVDI5 to work. It also need that dreadfull (at
least for non_MagiC users) WDIALOG in order to print.

>
>And, let's not forget Johan's MGIF: perhaps the fastest JPG displayer

You can't use the export function of Calamus for this.
>
>I`m not used to Calamus, that`s why I figure I must have done something wrong?
>
That's what you should do.
Load Calamus, load bridge module (Load external module menu).
Import a Gem vector picture into Calamus and leave it selected.
Go to the Bridge module and click on the name of the picture.
You'll get now a box where you can define the export format. Choose DXF
ofcourse.
Click on the export buttom (big floppy icon in the left corner) and ups
you go (I hope)
I'm not sure if the demo will allow you to do this though.

Systems For Tomorrow and Chromagic are still going strong. Atari Compting is still doing very well. Milan Computers are doing great and seem to be incredibly supportive of their machines....they update TOS on a regular basis!

Systems For Tomorrow will be carrying the Milan. Also, Godfather Computers have stated that they will carry the Milan as well.
My Falcon is being serviced at Wizztronics, and once it's fixed, I will trade in towards the purchase of either a Milan or Wizztronics motherboard kit.
Glad to hear that yoursettled and and doing well! :) Blessings to you and yours this Christmas season.

Hello Martin-Eric,

qf> One poster's point was to do whatever it takes to make the RSC work
qf> on any system. Nice in theory, except making 2 separate resources to
qf> cover for people who don't use AES 4.x (Magic, N.AES, etc.) is
becoming
qf> a waste of time.
I'm sorry, but do you took a look on the mentioned RSC?

If you had, you would see what the point is.

qf> cannot be expected anymore; we _have_ to move on.
I don't think that this is correct! "We *can* move on" is maybe the better

way. ;-)

qf> The same poster showed an exerpt from MagiC programming docs that
qf> said MiNT doesn't have threads. Then again, another ASH product
qf> also states that I-Connect is the only TCP/IP stack that provides
qf> PPP capabilities, even though MiNTnet has been supporting PPP since
qf> Jesus was born, so......
Maybe at the point of writing that, there was no MiNTnet with PPP?

AFAIR was MagiC the *first* possibility to surf in the net.

qf> there is _no_ standard way of programming for multitasking or new
qf> AES versions anymore, because MagiC deviates too much from the
qf> Atari-approved MiNT/MultiTOS specifications.
Yes. And to be honest, MagiC offered fast and TOS compatible multitasking

power at a point when MiNT stands just for "MiNT is *Not* TOS" (no word of

anyway sucking MultiAES, no thought of N.AES either).

qf> Then again, even the Milan uses MiNT+N.AES+Thing, so maybe it says
qf> something about what _is_ the de-facto standard, nowadays.
"De-facto" is such a nice word. It sounds good and says nothing. ;-))

On the other hand you can say: Users that want to have fast Atari machines

buy some sort of K6 running MagiC PC or G3 Power-PC with MagiC Mac. Milan
(or
Hades) came not even *near* the speed of at least a G3.

So, it's your opinion, but really no facts.

BTW: One thing that came to my mind: It's one thing to point on others
"stay
compatible to us, you are dividing the Atari world", whereas on the other

side it sounds like "stay compatible to us, you are dividing the Atari world".

Oops, looks similar ;-))

Greetings, Oliver

Hello Vincent,

VB> have you ever seen Linux & X11 run on a PC 386SX20 ? :)
VB> The hardware must also move on !
VB>
VB> It's a pity that very good old software don't run well with
MiNT/NaAES,
VB> but it shouldn't be a reason to deny what _is_ the future :
multitasking.
And if you don't want to buy new hardware, then you buy MagiC.

If you don't have a accelerated Falcon or TT, multitasking is not the
fastest
thing on Ataris.

It's very comfortable to sit down and say "move on, buy new hardware", but
as
my experience tells me, this is somewhat unrealistic. Atari has gone, the

"marketing power" has gone and if nowadays a ST user needs more power,
most
will search for a cheap possibility to get the rest out of his hardware,
hoping that it would last a time. Or he changes to PC or Mac, hopefully
using
his beloved software on that machine.

The people buying Milan or Hades are IMHO a small group compared to the
number of ST users. I suppose, if you are not a freak (and many, many ST
users are *users* not freaks - at least here in Germany) you surely won't

even notice the existance of Milan and Hades (maybe you know that Atari
doesn't exist anymore).

Hello DarkChyld,

t> into some consideration but...I propose that there are more Atari
users
t> out there with newer, upgraded TOS machines that are spending the
money
t> and driving the market more, and farther.
Because of my personal experience (programmer, software reseller) I would

disagree. I don't know the situation in USA or rest of Europe, but here in

Germany the ST was a *very* popular "working horse" used for DTP and word

processing, engineering, music, computing, ... in a way, the Mac was used
at
that time in the US.

The freaks are one world for themselves - worldwide. But here the average

user bought the ST because it was simple to use, had an excellent monitor
and
software and was not that expensive. Most of them can't even understand
the
word "upgrade". If you are lucky, they know the word "update". =:-)

They used/use the ST as long as possible, because it's still so easy and
the
speed could be better, but the software isn't that slow. So it is no
wonder
that
1. a product like MagiC was developed in Germany
2. so many users have bought it (simply to stretch the lifecycle of the
computer a little bit into the future).

Greetings, Oliver

Hi Al,

I wandered by your old web site the other day -- now I know why it didn't
work.

Let's see about the news:

Extendos now can write to CDR (audio only)

NVDI 5 is out

HD Driver still supports everything

RUFTrade got a GEM interface and a new distributor

SCANX Pro came out

Atari Computing seems to be running along about the same -- not 100% healthy
but getting out regularly and we're all grateful for that.

Aniplayer now does Real Audio (with some restrictions)

CAB 2.7 is out

Worms on the Jaguar was released, Battlesphere wasn't.

Gemulator now does Mac too.

The Milan (040) went into production.

Most of the people who were here when you left are still here.

Galen (Head YACcer, Yolo Atari Club)

> Maybe at the point of writing that, there was no MiNTnet with PPP?

MiNTnet certainly supported PPP in the TAF distribution which provided the
first Atari graphical browser (Chimera under MiNT/X). This was months
before STiK and STiK came out ages before I-Connect: I-Connect only
appeared with the first commercial release of CAB (2.0 IIRC), by which
point there were OVLs for both STiK and MiNTnet, and PPPKit (cut down
MiNTnet) had been and (largely) gone. The statement (in the CAB 2.0 manual,
IIRC) about I-Connect being the first Atari TCP/IP stack to do PPP was just
plain *wrong*. (BTW I know STiK is SLIP only: I mention it here for
timescale purposes).

> AFAIR was MagiC the *first* possibility to surf in the net.

Sorry, no. When I first connected (January 95), MiNTnet was already
available and so were a bunch of ported unix clients to go with it,
including the lynx browser. The only alternative at the time was NOS, which
would work under MagiC (with some fiddling), but also under singleTOS.

The first real stack for non-MiNT systems (as opposed to the all-in-one
approach of NOS) was STiK, which worked happily under singleTOS anyway,
MagiC not required.

I'm a happy MagiC user and found MiNTnet rather obscure and unfriendly, but
the notion that nobody could surf the net until MagiC appeared is plainly
absurd, and ignores the pioneering work of all those programmers who gave
us NOS, MiNTnet, STiK, CAB and all the other net software which is still
mostly freeware or shareware. ASH only gave us the first *commercial*
TCP/IP stack, which in typical fashion ignored the two existing "standards"
(apologies for using a loaded word here) for the platform, hence its rather
marginal status (just see how many people here use it, of those who use
their Ataris for net access, compared to the number of STinG/MiNTnet
users). In the net access stakes, MagiC was at the back of the queue.

For my part, I think both MagiC and MiNT have their strengths and
weaknesses, and which you prefer depends largely on what you want to do.
Most apps worth their salt work with either anyway. I'm glad we have both!

4658. Java plug-in for CAB?

Newsgroup: comp.sys.atari.st
Date: 1998-12-18 00:00:00 UTC
From: J WILKINSON <jwandjw@ihug.co.nz>
Message-ID: <3679C8AC.93F@ihug.co.nz>
Source record: 88015

Hi there,

Now that Sun Microsystems have removed the licensing fee that one had to pay to get hold of the source for Java has any group or individual within the Atari community taken it upon themselves to compile a Java plugin for CAB 2.x?

I realise that multi-threading/piping etc... are prerequisites for the OS under which Java will be happier running but many of us run Magic which meets the criteria I would imagine.

I have a Falcon 14Mb with a internal/external hard disks/CD-ROM etc...and I am learning Javascript as part of a 'make myself more employable' scheme. I am competent with HTML 3.2 but really need a machine with Java capable browser to prevent me from constantly visiting my father with a floppy disk full of my efforts to see if the Java side of my code is working on Netscape 4 on his Power Mac.

Please can anyone throw some light on this question? I would even be happy to beta-test a plugin if you have one...:)

Thanks,

Chris Wilkinson.

I had the same thing happen not long after I bought my Falcon.
Fortunately, Atari was still in bussiness, and repaired it under
warranty.
The Digital to Analog converter was toast.
Contact Wiztronics.
Do you use your Falcon for music recording? If so consider a Soundpool
converter. Sounds about a million times better.
Good luck.

By US Code Title 47, Sec.227(a)(2)(B), a computer/modem/printer
meets the definition of a telephone fax machine. By Sec.227(b)(1)(C), it
is unlawful to send any unsolicited advertisement to such equipment. By
Sec.227(b)(3)(C), a violation of the aforementioned Section is
punishable by law.

Sorry if you do not like my answer however your question sounds to me
like someone not willing to pay at first glance. I kindly suggested
an Atari dealer rather than accuse you of any wrong doing and you send
me personal e-mail as follows:

[snip] (header)

>Hi the Bigest looser man !
>I think you're loosing your time to answer this king of crasy thing. I'm
>ready to pay to have it. But where ?
>It's a shame that news group are frequented by a majority of people like you.
>Poor man ....

How hard is it to search for "atari" on the web and find a dealer?
I do not live in the UK and further more your english sucks and I
think sending me such mail proves you to be the looser here.

Good day...

As Jo says, everyone interested in doing anything with XaAES should be on
the mailing list. It has been very quiet for a long time, though.

>> I've not done anything yet but adding comments in the sources :)

I hope you started out with the beta7+ sources, since those are the current
ones. I spent quite a lot of time on XaAES about six months ago, fixing
most known problems and generally cleaning things up. For example, the
beta7+ sources should compile under both Lattice C and GCC.

For some reason, Craig Graham seems to have disappeared, so I don't think
there is anything about the latest development on the official XaAES WWW
pages. You can, however, find the latest sources on my ftp site.
(The latest binary is a week or so older, but I'll try to remedy that.)

>> please e-mail me at barrilli@club-internet.fr
>
>Then please join the XaAES mailing-list. I really can't remember if
>it's a majordomo-list, but if you send a mail to xaaes@rand.thn.htu,

It's not majordomo.
Just send a message to xaaes-request@rand.thn.htu.se with the word
'subscribe' in the header and you'll automatically join the list.

But it's just not so! A GEMbench-test (OK, it's GEMbench but that's the only AES-benchmark I know of) shows that MagiC 5 is about 5% faster than N.AES when handling the AES itself. What does this mean in real life? Absolutely nothing, zip, nada. You don't spend your time opening 50 windows per second anyway...

Some practical tests I did a few months ago (for a magazine-article that I never finished due to lazyness...) showed that opening documents in Papyrus, formatting HTML in CAB, recalculating a spreadsheet in Texel, compiling C-code, compressing files and a couple of other things I don't recall right now was just about as fast on MiNT/N.AES, MagiC and TOS. There were differences, but they were not consistent, some things were faster under MiNT, some things were faster under MagiC and most things were fastest under plain TOS. Background-processes (like compiling large projects or downloading/formatting html in CAB) was significantly slower in MagiC than MiNT/N.AES, which atleast *I* find very annoying.

> I think, we can just blow away our heads, but the Atari market won't come

Relying to ASH-products is perhaps not the smartest thing to do, because when ASH drops their Atari-products we're all stuck with unsupported products that we can't even fix ourselves. I'm not saying that everybody should drop MagiC in favour of MiNT, but praising MagiC and MagiC-only applications as *the* best thing is shooting yourself in the foot. It's OSS that will make our platform usable the next ten years or so, not ASH.

Yes, ScreenBlaster is up to version 3 (and has been so for two or three years). However, if you can afford it I'd rather recommend Videlity (from BSS) instead of upgrading the ScreenBlaster software. Firstly, SB 3 is not that good, I remember having lots of problems with MiNTOS with N.AES or Geneva as AES, as well as with MagiC4 (I haven't used SB for a couple of years).

Videlity will work fine with your existing hardware, is very compatible (I didn't have any problems with it) and is pretty easy to use.

Katherine "abuse" the selected-flag on some objects to create a rather cool-looking 3D under standard AES 4.x. Under MagiC it's possible that these objects are interpreted differently, perhaps this is what you're talking about? I haven't tested her programs under MagiC myself so I really can't tell.

However, I can't see how this differs from programs that use MagiC-specific objects that looks rather nasty on any other 3D-AES, except that Katherine's approach works on N.AES, MultiTOS and Geneva whereas MagiC-RSC's only works with MagiC...

> qf> cannot be expected anymore; we _have_ to move on.
> I don't think that this is correct! "We *can* move on" is maybe the better
> way. ;-)

Well, those that don't want to move on doesn't want new apps anyway, so why bother? I don't bother supporting anything less than AES 4 in my own programs, why should I spend even more of my spare time reinventing stuff that's already implemented in current AES'es?

> Maybe at the point of writing that, there was no MiNTnet with PPP?

Absolutely not. MiNTnet supported PPP when I first tried it (that's four years ago), and may have done so years earlier.

> AFAIR was MagiC the *first* possibility to surf in the net.

I have been using CAB with MiNTnet for about three years now, how long has I-Connect been available?

I'll be the first to admit that when MagiC first was released (was it in 91? 92?) MultiTOS was a pretty pathetic piece of software. The kernel (MiNT) was pretty crude compared to what it's like today, and the AES was a ugly hack which pissed all over MiNT's pre-emptive multitasking by hogging the CPU in supervisor-mode and doing a lot of busy waiting.

But why didn't they support the *documented* and *official* AES 4.x properly in MagiC, but instead invented some "standards" of their own? There was no good reason for this, a properly implemented AES 4.x is just as good as MagiC, which N.AES clearly shows.

> On the other hand you can say: Users that want to have fast Atari machines
> buy some sort of K6 running MagiC PC or G3 Power-PC with MagiC Mac.

It's not that simple, MagiC has it's own (x)bios and deals with all the
hardware itself, so it *needs* a rewrite for all new machines.

I've been trawling through a big pile of old cover disks. There's nothing that will put me off a program more than a poorly designed outdated interface. You know, something that ignores GEM for some unsightly eyesore, poor use of shaded areas, ugly non-GEM buttons and dialogs.

Particularly new software. There is no excuse for poor interface design and presentation particularly when GEM has always been such a stunner anyway.

Electronic Cow's stuff are all brilliant examples of how a modern GEM interface should look.

Agree? Or am I aesthetically retentive? Stupid to reject a program because it don't look pretty on my screen?

Mmm ... all very interesting.

I will try Cubase with MiNT although I'm sure I've tried in the past without success. I will post my findings here. Geneva too, although I find it a bit messy anyway.

As a community we do have to move on of course. But perhaps not as individuals, after all if our needs are met then why bother?

Having said that, as a musician the one thing that may well force me off the ST is hard disk recording (don't worry I will take the Falcon option, possibly a Mac if a windfall comes my way, but certainly not a pc, not for audio recording anyway)

As for the base level Atari machine. Well it would be interesting to know wouldn't it? I would be fascinated to know just how many are still in use worldwide. Perhaps some kind of on-line audit. Difficult but a worthy project. Take the Milan. How many do they expect to sell? 100, 1000, 10000, 100000?

Seems you would fail the "Atari History Test"..... *grin*

MiNTnet was first, then STiK followed, then STinG.
I-Connect came last.

> qf> there is _no_ standard way of programming for multitasking or new
> qf> AES versions anymore, because MagiC deviates too much from the

> anyway sucking MultiAES, no thought of N.AES either).

It might be a good idea for you to try N.AES before shitting on it.

Myself, I _have_ tried MagiC. I liked a few things about it, but
compatible is certainly not what comes to mind about Magic.

However, MultiTOS works fairly well. Heck I even used it on my STE,
before I got myself a TT.

> BTW:
> One thing that came to my mind: It's one thing to point on others
> "stay compatible to us, you are dividing the Atari world", whereas on
> the other side it sounds like "stay compatible to us, you are dividing
> the Atari world".

Well, like I said, I actually like some of MagiC's features, BUT:

1) no english programming docs available
2) english versions released 1 year after the german one
3) latest magic Mac/PC still not translated to english

Either ways, if I find some bugs in ASH products, the authors
always refuse to fix them and they blame them on MiNT.

However, MiNT stuff is Opensource, so people can actually do
something about bugs they find.

Personally, if Magic was Opensource also, I just _might_ make
the switch, but ASH is too stupid to understand the power of
the Opensource philosophy, so......

I agree, but partially:

1) ST users outnumber any other TOS machines * agreed.

2) Milan has already outsold the Hades and Medusa; soon,
the Milan will have sold more than the Falcon.

So, basically, while there are _many_ ST machines out there, you
will also find that more powerfull machines are rather common
(TT, Falcon, Medus/Hades, Milan).

Howdy Ken,

RS-Speed is simpler to install, since it's basically a single-chip
modification to the MFP's timing cycle. HS-Modem must be told it
was modified, by altering the configuration of MFP.PRG.

RSVE _does_ require a custom GAL chip to be programmed, AFAIR.
The only advantage over RS-Speed is that it goes beyond 38400
safely and stabily.

However, IMHO, the MFP is simply too slow of a design to correctly
handle anything beyond 38400, so I suggest the single-chip RS-Speed.

The RS-Speed schematics were published in ST Format also.

Hi there Al! Great to have you back!

I was always happy with your service, and pleased with the purchases that I made from you. I would love to see you get back in business again. If you just sold off your inventory and walked away, I wouldn't blame you. Dealing in Atari products these days is a risky business. (Then again, dealing with Atari products has been a risky move ever since the video game crash!)

Best of luck in whatever you decide to do. If you decide to get back into business, you can count on me as a customer. Please keep us posted on your plans.

By the way, if you are interested in "catching up" on the Atari news you missed, check out my Atari web page.

well, actually it should be possible to keep the ST and still
hard-disk record, thanks to the new outboard hard-disk recorders out
there (like the Roland VS, and the new Fostex recorder). These devices
have MIDI output, and support MIDI time code. Why not simply slave the
ST so that it does all the MIDI work, and let the recorder do the
virtual tracks, mixing the whole thing down later?

Or even better, get a good used Mac and a dedicated hard disk
recorder software, and link the two together via MIDI? That way you'd
still keep your ST Cubase to do the MIDI donkey work, and the Mac does
its thing. Granted, you would then have to have a bigger desk :)

that's some very interesting news! Have any figures been released
on how many machines have been sold?

I'll need this as ammo the next time "you know who" in
comp.sys.atari.advocacy starts spreading more of his FUD (he's started
yet another disinformation campaign about the Hades and the Milan, and
as usual he's laughably inept at it - and the thing is, I've been
getting e-mails from interested TOS users on where to get more info on
Hades and Milan, and there's been an interesting discussion going on
regarding different processors and processor speeds, and how they're
affected by the type of operating system run on top of them.

Would like to say THANK YOU to everyone who has responded to my post, both in the newsgroup and in Email to me.

Thank You for passing on all the information about the recent happenings in the world of Atari and for all the kind words about the Dungeon. Very, very much appreciated!

While the holidays are a hectic time, I plan on checking in here on a daily basis and hope to be a regular contributor.

I'm also in the process of finding a good internet serverand hope to have a website up sometime after the first of the year. I plan on it just being a support site for everyone using Atari products and not any sort of commercial site.

Thanks again for all the info and kind words that you have passed on to me. And its also nice to know that there are still a lot of devoted Atari users still plugging away on their "out of date... orphaned... obsolete" systems.

Happy Holidays to all!

Al

4683. Wanted: Mega4 ST or Mega2 ST

Newsgroup: comp.sys.atari.st
Date: 1998-12-18 00:00:00 UTC
From: comdungeon@aol.com
Message-ID: <19981218094323.04529.00001106@ng-ca1.aol.com>
Source record: 88040

I'm interested in purchasing either a Mega4 ST (preferable) or a Mega2 ST.

I'm doing a setup for my oldest son; because he uses a Megafile 60 and has space limitations, I'd like to get a Mega ST so that he can "stack" the Mega, Megafile, and monitor in one, neat orderly, pile and save some space in his already crowded apartment..

Anyone who has a Mega4 ST or Mega2 ST for sale or knows of someone who does, please send Email (with specific's and price, if possible) to "ComDungeon@aol.com".

Thanks in advance

Al Horton

Great to hear that you're back once again!

I think we had been exchanging some emails in the spring of 1998, or maybe even 1997, and I never got a reply on my last mail. No I know the reason. I thought that the Computer Dungeon had disappeared for good, but it hadn't. :-)

My brother and I are working on that Lotus clone for the Falcon, that I hope you remember. The game now goes by the name 'Reeking Rubber'. The latest official version is 0.9, but it was released some months ago, and now we're working on a Christmas-release. It will be delayed a couple of weeks however, but I guess no one will be offended if the release comes after Christmas. ;-)

If I remember it correctly you were quite interested in the game, and I asked you if you would like to be the official distributor of RR for the USA. We've decided to release the game as Shareware, so if you would like to handle the registrations in the US, we would be very grateful.

There's more info about the game, and the game itself, at our homepage: nature.atari.org

Merry Christmas!

Henrik Gildï¿½ aka Hencox /Nature

Hi Martin,

Do you mean on my Hades ? If so, yes it did work, but I remember that it had the same re-drawing problems that I get if I use WINX together with Cubase. (Screen outlines left behind when re-sizing editor windows.)

However, I find it very easy to re-boot into a plain system for Cubase using my trusty single TOS :-p (and as you saw, it runs very quickly indeed !)

Cheers - and a very Happy Festive Season to all on this group.

Paul

Yes, but look at your syntax. "Did", "was" etc, etc,...I'm talking about
now, today! Please don't tell me that you think users with 1 meg 1040's
are driving the TOS (after)market, doing most of the spending/upgrading?

Its just my humble opinion but I find that hard to believe. I think it
would be of greater benefit to all TOS users if the hardware developers
and software authors catered to the users who are focusing on newer
machines (clones/highly upgraded Falcons/TT's), and encourage those 1 meg
1040ST users to upgrade. (make them drool over the new stuff). ;-)))

Hello,

Does anybody know where I could find info/profiles for the great synth editor, X-oR?

It was supposed to be pretty popular in its day, but I haven't been able to find ANYTHING about it on the net.

Thanks!

Laurence Shields

4691. A Day at the Races

Newsgroup: comp.sys.atari.st
Date: 1998-12-18 00:00:00 UTC
From: mlake@melake.erols.com
Message-ID: <slrn77l7l1.jch.mlake@melake.erols.com>
Source record: 88098

The once commercial software, "A Day at the Races" (ADAR), for the Atari ST has been released as shareware. This includes its companion program called "A Day at the Races Companion" (ADARC).

ADAR is a simulation of the horse racing environment. ADARC is a program which adds more functionality to ADAR.

These programs run properly on the Atari ST, Ste, and STfm. There have been success stories of these programs running on an F030 with the use of Backward or Magi. I haven't been able to try these programs on any non-Atari TOS machines. If someone does please let me know if they work or not. Thanks.

You can find out more about these programs at:
http://melake.erols.com/~atari

You can download the programs at:
http://melake.erols.com/~atari
or
ftp://melake.erols.com/pub/Atari

These are rather slow connections to the Net. If someone would be so kind as to tell me some Atari archives that still exist then I'll make the programs available there. Thanks.

Feel free to post or email if you have any questions or comments.

4696. 56K modem DTE speeds ;-))

Newsgroup: comp.sys.atari.st
Date: 1998-12-18 00:00:00 UTC
From: Martin-Eric Racine <q-funk@hal.fishpool.com>
Message-ID: <Pine.LNX.3.96.981218215230.15051A-100000@hal.fishpool.com>
Source record: 88103

Somewhat of a followup to the recent thread about the TT's serial ports (something like: "56K modems on TT" as a subject line):

I was just checking for various 56K modems myself and it seems the Diamond Supra 56K supports a throughput speed of 230k4 for either its Mac or PC external models.

Obiviously, the PC model is our traditional choice, but I suppose the Mac version would work on the LAN port of a MEGA-STE/TT/Falcon.

It might be interresting to hear from people who actually tried a Mac version of the modem and finally learn how compatible Atari LAN ports are with Mac RS422 serial ports.

If you get around trying one, please post this newsgroup. ;-)

PS: needless to say, either versions come with a CD full of Mac or PC specific crap we cannot use (except for the HTML version of the User Manual on the PC disc - imagine the face of the retailer, when you explain you want a Mac modem with the PC version of the CD-ROM :))))

Well, when Atari Computing did their survey a while ago, they found a pretty large number of STs to be sure. Perhaps we should encourage them to take a new survey.

I agree that if 50% of Atarians use TOS 1.x then it should still be catered to. But what if the higher end machines are all that's left?

Dan,

I've been looking at this a bit as well. The Centek2, Afterburner, Hades,
Medusa, Milan, etc. all have different strengths and weaknesses, I'm sure, but
I'm ignorant of them. Are you compiling data?

Galen (Head YACcer, Yolo Atari Club)

Hi Lawrence,

I have X-or too, and heard at one time that you could just get the profiles from MOTU's web page. (Mark Of The Unicorn) They took over X-or and the program is now called "Unisyn" - only available for PCs and Macs. However, the PC (or Windows) profiles will work on the Atari. I tried it, and it worked(!), so there are profiles for just about everything available to download:

http://www.motu.com/english/software/unisyn/unisyn.html

You haven't found anything in your searches because the original maker of X-or, Dr. T, is no longer in business, I think. At any rate, they no longer support that program.

Which prg's do you mean? The good old 1stword+ works with MiNT/N.AES and
so does my very first prog I bought back in 1988, Superbase prof.
If they are written cleanly they should work.
The only prog I know which doesn't work at all with MiNT/N.AES is
MegaPaint Professional Version 4.00. IMO a pity because it's a good
application. Ah well that's live.

Oh? very easy actually.
You, Chris, go on the Micq official page on the web, I can even give you
the URL if you can't find it with all the websearchers available.

Get the latest version of micq, all the sources are there, all desrcibed,
all the secrets of icq are in the archive.
Then recompile all that for Magic and Sting.
Shouldn't take much effort to do so and should work rather well.

> was modified, by altering the configuration of MFP.PRG.

Don't make it look like a disadvantage ! With that modified configuration
of MFP.PRG, the new baudrates are visible in programs like my Serial Setter
or CoNnect. With RS-Speed, all that is possible is precisely what one gets
with RSVE if that modification of the configuration is simply omitted, and
one needs to translate in mind which old (slow) baudrates must be set to gain
which new baudrate.

> RSVE _does_ require a custom GAL chip to be programmed, AFAIR.
> The only advantage over RS-Speed is that it goes beyond 38400
> safely and stabily.

The other big big advantage is that it is supported by HSMODEM.

> However, IMHO, the MFP is simply too slow of a design to correctly
> handle anything beyond 38400,

Which simply is not true. What is to slow is the basic STs CPU, and the
original inefficient TOS routines that handle the MFP. Ken hasn't mentioned
if his nephews STE is a 1040 STE or Mega STE, I suspect it's the former, so
HSMODEM is a must anyway.

> so I suggest the single-chip RS-Speed.

Since HSMODEM with its extended capabilities has become a quasi standard,
I'd recommend RSVE. The GAL can be a hassle that's true. Harun Scheutzow
used to sell programmed GALs, maybe he still does ?

> good OS?
> MiNT however runs AFAIK on every machine be it a modest 1040 or a Hades
> 060/Milan.

I you think about what you wrote, you'll have to admit you wrote a neat piece
of bullshit. What is the task of an OS ? If you do not remember, I'll help you :
It provides an abstraction layer to the applications that need to run on the
machine, so that the applications do not need to bother about hardware specific
stuff. The latter is the OS's task, and there is no way to make an OS run on
every different kind of hardware. MiNT appears to do so since it is not really
an OS : It still uses parts of TOS to do some low level things. Now you'll admit
that a "reunion" of MiNT and TOS (meaning the ROM stuff here) does not run on
every hardware without changes. The TOS 3.x ROMs cannot be used in Mega STEs,
and TOS 2.x cannot be used in STs, even if you thow away the vast pasts that
get replaced by MiNT, because it's just the remaining bit that is most hardware
dependent.

So even if you try to turn it upside down : It's the OS that needs to be fitted
to the hardware, not the applications. And surprise surprise : If you follow
Atari's specs for programming, your software does run on MagiC too ! So do not
try to use Atari's specs to argue your way, it doesn't work.

If Katherine says, she won't support MagiC, she unintentionally admits she doesn't
follow Atari's specs when programming. That's her decision of course, but it's
certainly not a opportunity to argue against MagiC.

> My 2 cents

This by me is not 2 cents, but common sense.

> hardware-dependent code in MiNT itself.

By saying that you admit MiNT is not complete when assuming it to be an OS.
So saying "MiNT is an OS that runs on every hardware" is a contradiction.
Add TOS' Bios and XBios to MiNT, and you'll get an OS, but it's not hardware
independent anymore.

> That's correct, MiNT has been modified for the new clones. Since the
> source is freely available it didn't take long either...

So that were a valid issue to be discussed, MagiC as being commercial against
MiNT being free (open source). MagiC being "incompatible" against MiNT being
"compatible" is just plain nonsense.

>> At least, BIOS and XBIOS - the very deep core of an OS - have to be
>> hardware dependent.
>
> Ofcourse, but these already exists in TOS. They're not perfect, but it
> makes MiNT highly compatible and easy to port.

And that's a different Ansatz compared to MagiC. MagiC reimplements them to
make them nearly perfect. It depends on priorities. MagiC opts for a maximum
of modern concepts in the OS, that's for instance reentrancy in all parts of
the system, things that can never be gained with MiNT. It has the price that
improperly (i.e. not following Atari's specs) written software has more
problems running compared to MiNT. Whether you're prepared to pay this price,
is entirely your own decision, but it must not be used to call one of the
two options worse than the other.

> The reason why MagiC
> doesn't work on the Milan (and why it took ages before it was ported
> to the Hades) is that ASH has to rewrite large parts of the (x)bios,
> and being a commercial company they won't do that until there's a
> certain userbase.

No that is stupid (please note that I do not advocate ASH, I'm very much against
several of their ways of doing things). ASH does not rewrite anything in MagiC.
That is _all_ Andreas Kromke's task. He is not a full time programmer, and he

does not have the money to afford every model of machine (I'm sure he neither wants one of each). So availability of MagiC for a new machine depends on how he gets access to one. AFAIK, the manufactures did not bother borrowing a Hades to him, he had to get together with some Hades user.

>> tuning. But MagiC has large parts in assembler (which makes it so
>> incredible
>> fast) so the changes are more difficult.
>
> This is a myth! Run MagiC (or NVDI) through a reassembler and have a
> look at all the compiler-generated code in there...

Having "large parts in assembler" does not mean "all is assembler" ! It's your own fault if you target the reassembler to the parts that are not in assembler.

> Practical
> benchmarks also shows that MagiC isn't "incredible fast" compared to
> MiNT or TOS.

Taking the most important task of an OS, access to filesystems, and taking the by far most popular filesystem (FAT), MagiC is "incredible fast" compared to MiNT, at least until very recently. I've heard recent MiNT has it's own FAT drivers, I've no idea how they compete.

You do not do a fair comparision, if you optimise the benchmark conditions to suit best your favoured choice. Take real life conditions !

> It can *feel* faster though, because it dynamically
> assigns almost every CPU-cycle to the top application. Imagine what
> that does to background-processes...

This proves that you should better not argue about MagiC in the first place. That is, if you really do not even know that the ratio of top app timeslice to background app timeslice is a user-configurable option.

>> actual non Atari hardware) you have to decide: Use a slow OS on a slow
>> computer (but with Unix compatibility) or use a fast OS which makes the
>> computer more faster to work with (but "just" with TOS/GEM compatibility).
>
> Another myth, "MiNT is slow". This is pure BS, and only shows how

> qf> Jesus was born, so......
> Maybe at the point of writing that, there was no MiNTnet with PPP?

No. MiNTnet's PPP is much older. ASH simply doesn't care to investigate.
After all, it sounds so much better to call it the "first PPP stack" for
Ataris (ignoring thinks like NOS too) ...

> AFAIR was MagiC the *first* possibility to surf in the net.

Another one. STiK was the first possibility to surf on the Web with MagiC.
Even first versions of STinG (without PPP) went public before PPP-Connect.
IIRC, even STinG's PPP were just two weeks or so before PPP-Connect, but I'm
not sure here.

But it's enough for me to agree with Martin-Eric's opinion of calling ASH's
advertisement marketing propaganda. If Atari software were a significantly
bigger business, ASH had been sued numerous times.

Precisely, and that's one reason why this number is irrelevant. The other is
that we do not compare MagiC and N.AES but MagiC and MiNT. MiNT is (was ?)
really slow accessing FAT filesystems, that's an important point.

You've tested

> Some practical tests I did a few months ago (for a magazine-article that I

So that makes a lot of sense at last ! ;-) Still, AFAIK for many of ASHs
products, the copyright is with the original author (ASH merely markets it),
so the author can turn to other ways of publishing.

Why do you put it in quotes ? This *is* abuse. It is the very sort of behaviour
that creates all thoses compatibility problems we fight nowadays. I do not
understand how Katherine can rant on other programs for not doing anything
worse that what she does herself.

Atari has specified several flags in OBJECTs as user-definable, why couldn't
she use those ?

Cheers Peter

The point is, English is a de-facto universal language right now.
Everyone can understand it. Finns learn it, Russians learn it...
German is not as accessible nor common.

Hi,

I just was given a Canon Multipass C20 multi function printer.
It can print BW 720 x 360, color 360 x 360, fax, copy and scan.
IF I can get a driver for it for
- NVDI
- Calamus
- Papyrus
- Idealist

For now it does not react AT ALL to my Falcon. Could it be the
Canon Multipass C2O is just one of those devices that only can
live in a Windows environment (2way communication with Computer)
or can somebody help me to get some Atari drivers for it?

Greetings,
Jan

Related to all this, I wonder if anyone knows sales figures for TOS/GEM machines made by Atari?

I did find a mid-1989 interview with Sam Tramiel, who was asked how many STs were sold up to that time. He guessed that worldwide the number was approaching 1.5 million.

A few questions later, Sam was asked about projected American sales for the ST: "... if we don't sell 100,000 machines here this year, then there'll be big trouble."

Accurate sales figures must exist somewhere, since Atari paid royalties to Digital Research based on a per-unit basis. I really doubt total Atari TOS/GEM sales would have exceeded 3 million units (including the TT and Falcon). But this figure could be wrong, since I have nothing to substantiate sales after mid-1989.

Magic runs on Real Atari machines with no problem. It's the Hades that
needs to be made properly. If it was a TRUE atari compatible machine,
then MagiC wouldn't need any modifications.

A French man is working on GEM-ICQ as we speak. A release 'should' be ready early next year, and yes it's runs under STiK/STiNG :)

I personally can't wait

PS I think you need to have an ICQ number first though. Best borrow a PC then :)

there's also Cubase Audio 'ST' and the Yamaha CBX-D5. 4 tracks of audio,
contol fully intergrated into Cubase. Both items hard to find but relatively
inexpensive when you do.

Bonjour,

Dans son message ï¿½ï¿½Calamus SL'98 display problemï¿½ï¿½, Derryck Croker a ï¿½critï¿½:
ï¿½ï¿½Is anyone else having a problem with the above (on a Falcon, 256 colour
ï¿½ï¿½mode)?

No problem on hades. Did you tried on Falcon, 16 color or 2 colors
mode ? Which release of SL 98 ? (I've got the August one)

ï¿½ï¿½Scrolling the window up or down results in the page contents smearing
ï¿½ï¿½extremely severely or else they're redrawn incompletely with either top or
ï¿½ï¿½bottom missing. About the only way that I can get the page restored is by
ï¿½ï¿½using MagiC's "tidy screen" to force a redraw.

Did you tried without magic ?

ï¿½ï¿½I can't lay the blame at anything else - this happens even on a clean boot
ï¿½ï¿½and I've tried various copies of the falcon8.prg that are at hand in case of
ï¿½ï¿½corruption.

Did you received the falcon8 of August SL98 I've sent you a few days
ago ?

Are you a member of the former Atari 'scene'? Did you, perchance,
visit the "ST News International Christmas Coding Convention", in Oss,
Netherlands, December 1990?

Then you should not wait a second longer and surf over to
http://www.scriba.org/stniccc2000 to discover that, in fact, a reunion
of that very historical event is being organised for December 2000, a
10th anniversary reunion as it were! It is going to be the coolest
event on the other side of the millenium change, I can assure you!

Follows the tracks with the schematic / description in DOITF030.
Replace capacitors up / downside on mainboard first.

(If it's not a problem with the jack!)

If you can't do this by your self, ask people the can do that.

Regards, Robert

Your FATs are trashed, I'll bet. Files were copied to about the
limit of your write cache, then it hung. If you copied one big file
it was okay; multiple files totalling about 64K were okay; above
that - disaster. How is my crystal ball doing so far?

If you obtain a high quality scsi cable, all your problems will
disappear. It sounds crazy (how much difference can there be?), but
it _is_ what cured the exact same problems here.

You will have to reformat/repartition, and restore from backups.

I paid $60US for a cable from Computer Direct, and I have seen the
same one in CompUSA for about the same price. Interestingly, my
friend bought an EZ135 that came with an _excellent_ cable, as good
as or better than the $60 Belkin. Since he doesn't need this one, I
have it here (maybe the one in use now, but I'm not sure). He might
be willing to sell it.

My advice: start with the cable, then fix the termination, then ask
Dr. Siemet :)

4734. ANN: CyberSTrider Press Release

Newsgroup: comp.sys.atari.st
Date: 1998-12-19 00:00:00 UTC
From: denesh@cyberstrider.org
Message-ID: <367bdd53.12779065@news.demon.co.uk>
Source record: 88061
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

CyberSTrider are constantly looking at improving ways of accepting payment from customers. We are pleased to pre-announce the acceptance of payment in 'Euros' from January 1999.

The Euro is a welcome addition to our current payment methods - GBP and US Dollars (at no extra charge).

The addition of the Euro outlines our commitment to the customer, by making it easier for you to pay for a service you buy from CyberSTrider. This is by no means the end of seeking for other payment methods. Credit Card, Cybercash and on-line ordering are in the pipeline and will be available as soon as commercially viable.

Further details will be available in January, with all GBP prices complemented with the Euro price.

CyberSTrider has been running for over five years (since December 1993) starting out as a shareware registration site for UK users only. The aim was to make non-UK programs available to UK users in local currency.

CyberSTrider have since branched out in to other countries and various other markets (including PC, Mac and Unix shareware) and other business areas.

Payment Acceptance history:
1993 - GBP prices for mainly UK users
1994 - Acceptance of Int. Money Orders in UKP from Canada (no charge)
1994 - Acceptance of cash in any currency (extra charge added)
1995 - Acceptance of European Currencies via Eurocheque (no charge)
1995 - Acceptance of US Dollar cheques (extra charge added)
1998 - Acceptance of US Dollar cheques and cash (no charge)
1999 - forthcoming - Acceptance of Euros (no charge)

Regards
Danny

Before you blame and mess with hardware, make sure the software is set properly.

On bootup, do both drives start. Does AHDI show both units responding. If yes, check your desktop.inf file to make sure you have the drives installed.

If AHDI does not show both drives as responding (you'll see it on your bootup screen) get a program called AHDI configure. You can check around the various FTP sites for it. AHDI configure will have an option to force the driver to search all ASCI, SCSI and IDE drives.

On the hardware side. reverse the order of the drives. TOS will boot from the first GEM partition it finds, and you may have the drives in the wrong order and GEM is booting the wrong driver of the wrong partition.

Make sure the drives are plugged in and turned on.

Hope this helps.

Speed of Light will do JPG and GIF. If you want really incredible
output convert the JPG to TGA and then display with either
Photochrome4, or 24bits.tos. Both will display the picture in tens of
thousands of colors. The 24bits.tos program is real quick, whereas
photochrome takes a while. You can also convert them to spectrum
format and have a 512 color display which you can edit with spectrum.

Single tos is not gone, and if more people would utilize the most powerful feature of TOS. This is the long forgotten desk accessory and CPX panel. Why can't Cab and Newsie work as DA's. You hqave 6 DA slots, control panel, sting dialer, newsie, a text editor and aniplayer. This along with CAB would be a very powerful internet tool, allowing quasi-multitasking on a 8mhz machine.

>(three
>compared to the new version).

My brother has a G3 running MagicMac (version 5 of somethig like that). As far as I can see there isn't a big different between my Hades 060 and his G3. Calamas SL 98 seems to run just a tiny bit quicker on the G3.
A few months ago I did a Gembench test. I don't have the figure anymore but from what I recall the G3 was 14 times the speed of a TT (+ FPU, ST High) whereas my Hades is 13 times faster. If I don't use NVDI I even get 15 times.

Working with the G3 is nice but sometimes a nightmare too. How to print Calamus docs with a HP lazerjet 5 (non-postscript model). Do you know a fast solution?
Furthermore copying with the Mac is very slow which can be said of the boottime too. Boy at the time that the G3 is booted I already has reboot my Hades 060 -running freeMiNT 1.15/N.AES/Thing and quite a few other autostart application- twice.
On a Performa 6300 you can easily go to the toilet before the whole thing is booted up.

I do know a professional printer who is already regretting he has bought a G3 (with MagicMac) to replace his TT030.

That's why I glad I'm a Flemisch speaking Belgian. At school we all have
to learn French and English, sometimes German too.
As German looks more or the less to Flemisch I don't have much problems to
use German prg's. Most of my progies are in German. Some are in English,
others in French but only one is in my native language (Calamus SL 98).

I understand that the most do have problems to understand German. I really
a pitty that all these goodies aren't translated.
I'm convinced that if the programmers should take the efforts to (get)
translate(d) the prg's and docs they should get a much greater market then
now. Take for instance N.AES. It's already two-three years on the market
and apart from some very dedicated Atarians like Jo Even Skarstein who
translated the previous N.AES release into Enghish, there isn't any
official English release yet.
Should there be an official English release I think that N.AES would be
more commenly used then now.

>using MagiC's "tidy screen" to force a redraw.

I don't have an idea but is there any change that MagiC has some kind of
real time window scrolling? N.AES has such a function. I've severe
problems with Calamus SL 98 (and a few others) if this option is
activated. After a certain time I can hardly use the popup menu's of Calamus.
If this happens all I can do is use the keyboard shortcuts to save the
work and quit the Calamus.
I also know that the English version as provided by MGI contains lots of
bugs which has been fixed (more of the less) recently by Invers software
Vertrieb. I have both versions, the MGI and the Invers software Vertrieb.
I can tell you for sure that the MGI one was hardly usable on my Hades
060. Furthermore lots of MGI modules refuse to work. It has cost me a
quite some money to get registrated at Invers software Vertrieb but I
don't regret it. Oh boy using Calamus SL 98 is a pleasure again.
The latest update has been releashed on september.
Maybe you should try the latest demo version of Calamus SL 98 to see if
the problem still resist. The English version can be found on the homepage
of Invers software Vertrieb. You can find the URL on the UTSI page (see my sign off),
follow the Text/PAO link

Actually, Tempest isn't yet available (according to Titan) and should be released in the first quarter of 1999. Also, the price is just a goal and not completely set in stone. I've been told that they are looking into the possibility of using a 200MHz PowerPC, but only if it works well in the card. Otherwise it will have a Coldfire 68040 capable of running at 40 and possibly even 50MHz (with Nemesis?). Still not bad compared to the standard Falcon. It will also have an AGP port for the newest type of PC graphics cards and up to 256Mb of SDRAM. Very cool! Very fast!

Also, don't forget the Centurbo II. A little bit more difficult to install than the Tempest will be, and a little less powerful, but not as expensive and once again not bad when compared to the standard Falcon, and also available now.

Hi Tom,

Tom the only problem with the above is that I can even go as far as
formatting the hard drive, but that it (hd Driver) says that there were no
suitable partitions found after I had wrote them. What is alot more funnier
now is that I can't even get the other Mega STe to recongise the hard drive
when I attach it . Oh what fun this is!

Thanks for your suggestions.

Message-ID: <367BFA2E.33C5@primenet.com>
Source record: 88078

Another exciting installment! OK, I tinkered again all
day...literally. My right channel of sound is out, as you know. I don't
think it is my digital to analog converter anymore, because I can get
right channel sound from the internal speaker connection on the MB. What
I did temporarily to get almost descent stereo is solder the internal
speaker plug to the right side headphone jack capacitor, now I get left
channel in the left side, and right AND left in the right. It's kind of
good. I think I will probably have to check every capacitor having to do
with right channel sound, and when I find a bad one simply replace it.

So if anyone else has or had this problem, this is very likely the
cause, unless someone out there knows something I don't know.

Also, I am curious, does anyone know if there is an external digital
to analog converter available for the DSP port of the Falcon, just in
case I never fix it right for the headphone jack? Thanks. -Satcom2

Hi,

Has anyone managed to get a working email account with Yahoo using just an Atari ?
After a bit of messing around, I eventually got allocated an account but am unable to access my mailbox.
My original password was not accepted and I went to the appropriate page and was given a new password - which was again not recognised !
This happened a couple of times but then the latest one worked - and I was sent to the 'cookies problems' page where I am told that my browser does not handle cookies !

I have tried using the .OVL files by both Dan and Olivier and get the same results.

Any ideas ?

Jim.

4754. Hades and HS-Modem

Newsgroup: comp.sys.atari.st
Date: 1998-12-19 00:00:00 UTC
From: jlog@zetnet.co.uk
Message-ID: <75h1h7$372$1@irk.zetnet.co.uk>
Source record: 88081

Many months ago, someone on the newsgroup had difficulty with setting up HS-Modem on their Hades. The Hades has a Z85230 as opposed to the older Z8530 present in the TT (and perhaps other machines). In theory machines with a Z85230 can use ESSC.PRG rather than SCC.PRG but this person had found that their Hades hung during the boot process. This also happened to me and I suggested at that time that he use SCC.PRG instead.

I assumed that the Hades would behave like a TT and had in the AUTO folder the following programs: DRVIN, MFP, SCC, MFP_TT. I was puzzled, however, by a message during MFP_TT boot up suggesting an error. Recently I have been experimenting and have found that MFP_TT does not seem to be required and that a set-up of DRVIN, MFP, ESSC does not cause problems when booting and seems to work with most programs. Because of the higher clock speed in the Hades a true baud rate of 57600 seems possible with Modem 2.

Is this the best set-up for a Hades?

John Logan

Hi,

just trying (again) with this (Free)MiNT stuff, having experimented with XaAES before.
I got the 1.15.1 beta 0.2 version for 030, together with GEM.SYS from the basic package.

Running from a testpartition with only Mintnp.prg in the folder is OK, I get GEM.SYS running too but in 320x200x4... No way of getting to ST-Hi or TT-Med. Everytime a box "stop all running apps" appearing.

Using XaAES is OK in TT-med. Does Mint/Gem.sys read the Newdesk.inf? Tried to set rez to TT-Med in that one, but still the old ST-Low coming in.

Can't find anything in the Gem.cnf or Mint.cnf that refers to rez...

Anyone?

I use DRVIN, MFP and SCC.PRG. I don't understand what you mean by true
baud rate of 57600. With modem 2 you can go to 230.400. I use 115.200.

>The only advantage over RS-Speed is that it goes beyond 38400
>safely and stabily.

Hmm, see below.

>However, IMHO, the MFP is simply too slow of a design to correctly
>handle anything beyond 38400, so I suggest the single-chip RS-Speed.

That's not true of the MFP in my machine. It's very stable at 57600
using a slightly modified version of the CD4040 upgrade. I've got it
set up so I can use 57600, 38400 or the normal, slower rates, at the
flick of a switch.

One thing to note is that when using STinG with a serial port rate of
57600 the throughput is ~2600cps, whereas at 38400 it's ~3400cps. If I
try connecting to a BBS, the transfer rates are both ~3400cps. Finally,
a direct link gives transfer rates of ~5550cps and ~3700cps respectively.

All these transfers were performed using the Magic 5.11 OS (m/tasking).
Connect was used for the BBS and null-modem tests, and a 33600bps modem
used for the BBS and net tests. I've not tried the same tests under TOS
since I had the occasional dropped character at 38400 w/TOS 1.62. Nor
have I tried s/tasking Magic, since the transfer rates will only have
a marginal increase over the m/tasking rates.

Anyway, if anyone's interested in how to modify the 4040 upgrade, let me
know and I'll see about writing up how I did it.

Greetings;

I've got 2 SM 125 tilt swivel mono monitors and an SM 124 mono monitor for sale or trade

I live in Ontario Canada and delivery or pick up is preferred.

$50 takes them all!

Got a mega II system with colour monitor and megafile if anyone's interested. $100 picked up only.

Regards,

Willard

Well, afaik the megaste and the falcon are real atari machines. and Magic
is a no-good. So your Hades thing is irrelevant.

> It's the Hades that needs to be made properly. If it was a TRUE atari
> compatible machine,
Hades that needs to be made properly?
As in replacing the crappy ET6000 by a stvideo chip? st video mode..
4meg limit, a true 68000 and not the weird 68060 ,no ide nor scsi, no
nothing basically.
Well why having an Hades at all then?

> then MagiC wouldn't need any modifications.

Weird weird weird...
I guess a 1040 STE with magic is the killer machine then.

Source record: 88093

Hey dude,
Magic-PC is the fastest, bestest of all.
stzip only took 1 sec for a 4meg archive. whoao.
Tell me, why do you need magic or TOS?
To run stzip in 1 sec rather than 6 sec?
Speed is needed for heavy calculations in some applications.
What I don't understand actually is, having a G3 or a p450Mhz to run TOS!
for what applications that is worth all the trouble?? Don't mac and PC
have any applications?

to run CAB? netscape or IE won't do the job better anyway?
graphic, isn't photoshop enough for you that you need to run papillon or
such?
games, hmm games don't run in magic, and PC for games are rather
interesting.
Video? same, with all the applications available on pc/mac WHY the hell
would you need aniplayer, or m_player or such, EVEN at a wonder speed..
DTP, calamus under magic PC is really that much better than all the tools
for win95? Quark express doesn't cut it, or even Calamus PC. There are so
many choice that to me, investing in a TOS emulator, NO matter the speed
is worthless. Ask yourself why you use atari.

The plan is this:
1 guy with a nice atari setup, pretty happy, gets his head filled up by
some ASH, or whomever else that magic-pc will be the same if not better.
And still they are considered atari users because they use magic-pc.
The guy confidently, sells his TT/Hades to get a PC with magic-PC.
What will happen next?
1) Most applications won't run as expected.
2) some applications will run VERY fast (raw power). Like whoao, it only
took 11sec to compile this project.. When on my TT it took WAY longer, at
least 2 min...
3) The magic-pc users will invest his money where? in atari market or
microsoft product?
Pagic-pc is a perfect bridge for atari users, getting them to switch from
one to the other.
Imagine:
" Honey I need a word processor to type my letters"
"Ok I am gonna buy Papyrus 7 to run under Magic-pc",
"WHY?? why don't you just buy Word perfect, less problems, I don't even
know how to run magicpc emulator, and Will papyrus do everything Word
perfect does? "
"No it won't but it is to support Atari community that I will buy papyrus
for magic-pc"
"Yeah right"

"Honey I need to browse the web, how do I do?"
"I will call ASH, and order CAB 2.7, only XXX USD, quite cheap"
"My friends have netscape and IE for free!?, why should we pay for a weaker browser? can't even view half the pages, no java etc"

Basically, The magic-pc user will use his old software because it is a big investement he has made over the years. But newer versions, you can be sure, the computing money won't go for atari applications"
But true, it runs fast, whoao.. (who cares?? who really does some 3d animations under magic-pc?? raytracing with what? POV? well POV pc version also exists!, doesn't justify the need of magic-pc"

This is reality, unfortunately, I am sure the first intentions of magic-pc/mac are good. But in a long terms it doesn't help anything really. I am well aware that some people running magic-mac still code atari applications, and that is great, but is nothing compared to all the moves the users have been taking...

Which one of those people is more an atari user?
- a guy running NETBSD on his TT030?
- a guy running magic-mac on his G3?

Hardware versus software.
WHat makes atari fun?
What makes atari attractive?
What makes me still loving it?
Those are the questions, probably too hard to answer.

Please, take a look back to the whole situation we are going thru.
Then put a message in this very same usenet group to all discuss.

This is a very important thread in case you were wondering, or not realizing. It is the future of atari, And yes, I am an atari freak and everyday users/lover. I have no intention to go to PC, not that I would hate it, Just that there is NO need. Home-computing is a hobby, some people collect beer bottles, some other stamps, me, you guessed it is computing and music.

Please, do not ruin my hobby by taking away the few users there are left already, I won't have the pleasure to share my passion with anyone else anymore...

Thanks.

From: Dimitrios Bitzenis <dbitzenis@hotmail.com>
Message-ID: <75h4h3ghi1@ns1.otenet.gr>
Source record: 88094

Thanks to all for your quick response to my questions.
First of all lowering to 2 colours from 256 I improved it enormously .
Now fast enouph.

My other questions are now :
I have the Falcon 030 the first model NOT the MK II
I bought also a SPDIF from Blow-UP with nine leds lighting like crazy.
The manual is German but I saw the 16 to 24 bit compatibility !
Where are the 24 bits if it can input or output ?
Can Falcon work somehow with 24 bits ?

Also what accelarator can I use safely and where can I find the memory board
to connect 16 MB ?

I also heard of a possibility to connect 128 MB from outside.
Is this possible with my simple Falcon 030 ?

Thnaks to all of you
Dimitrios

4768. Help me please!, How to connect atari st to rgb scart??

From: phantomm@kih.net
Message-ID: <75es9tlaq1@dbtsvr2.dbtech.net>
Source record: 88121

Hi folks,

Months ago I sent my original Apex Media disks to Systems For Tommorrow
along with payment for the latest upgrade.

It was my understanding that the disks where to be shipped to Titan
for the upgrade and quite a few folks where sending their disks
through SFT as well.

Just wondering if anyone has received there upgraded Apex disks back
yet?

I know these things take time...just wondering?

phantomm@kih.net

4772. Falcon 030

Newsgroup: comp.sys.atari.st
Date: 1998-12-19 00:00:00 UTC
From: Dimitrios Bitzenis <dbitzenis@hotmail.com>
Message-ID: <75eua8$d5g$1@ns1.otenet.gr>

From: dwmoar <dwmoar@spiritone.com>
Message-ID: <367AF749.5FB37AD4@spiritone.com>
Source record: 88123

Got rid of the Falcon and got a TT. I like it alot but am have some problems with the hard drives that I can't seem to figure out. Perhaps someone out there has seen these problems and know a solution to them
First of all I am running a TT with 4 megs memory and HD Driver 7.5x. When I connect my hard drive to the SCSI port and try to boot some times all it displays is the line "HD Driver and the copyright date" and than it hangs. Other times it will boot saying "No partition found" If I run the ID Check on it sometime it will find the drive on the SCSI chain, most of the time it doesn't. It always seems to find device #7 the SCSI Libary though. Last night It did boot twice and came to the desktop. YEAH! much to my shock when I tried to copy anything it froze, with the HD access light on. I am using SCSI arbatration (sp) I can not even get it to work on the ACSI port using the Link97. BUMMER I get the same thing. What is worse I can no longer get it to work on any other machine that I have. I have even tried it on a friends machine with the same results. HELP HELP HELP

Thanks in advance.....

My very first Internet prg some three years ago was NOS, soon followed by Oasis. At that time it was the only possibility to use PPP. A few months later I discovered the TAF package and so MiNT/MiNTnet. For me it was just unusable because the whole system (X-window) was too slow on the TT but it was nice to have a browser though. I wasn't aware of other possibilities. Then came STik but not usable for me because it offered just SLIP and not PPP and then came gluestik which maked it possible to use MiNTnet's ppp connection. Oh boy the big fun could begin then. Gluestik came on the market long before STing and Iconnect.

GIANT ATARI ST HARDWARE / SOFTWARE / MAGAZINE / BOOK BLOWOUT!

Yes, our sale is still happening! All prices knocked down another notch. Check it out!

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

Please look through our list and pick out something you can provide a good home to. All hardware/software is fully guarenteed for 2 weeks from receipt. Everything comes with full email tech support from a knowledgable STUG member, we'll try our best to help you out!

If you want a whole bunch of stuff, discounts are available. Let us know what you think is a fair price. We just want good homes for all this STuff!

Every item purchased includes an issue of the STUG Chronicles (our newsletter) FREE!

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly.

Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

Trevor Cordes - STUG President
trevor@cyberspc.mb.ca

*** MUST SELL THESE MAGAZINES TO GOOD HOME! SEE BELOW! ***

The Winnipeg ST User's Group (STUG) is having a huge fundraiser to help keep our still-going-strong user group in good health, clear out some useful software that isn't getting much use, and help members do the same. The majority of the proceeds from all sales will go directly towards helping the club which has been promoting Atari since 1986 in Manitoba, Canada.

All prices are in US$ funds as most sales tend to be to the US and so it makes everything easier that way. Canadian prices should be calculated accordingly. Shipping is extra and NOT included in the price listed.

Thanks for helping out our user group!

4779. Probs with Lattice C

Newsgroup: comp.sys.atari.st
Date: 1998-12-19 00:00:00 UTC
From: tNhOoSpPmAaMn@uoguelph.ca
Message-ID: <75f3ou$8nr$1@testinfo.uoguelph.ca>
Source record: 88129

So I bought myself a copy of Lattice C for Christmas, and am just now beginning to fiddle around with it. Unfortunately, I don't seem to be able to link any of the example programs. Compiling works fine, but clink returns an error 426: Cannot find object <file>, reporting that it can't find the object file containing the startup code (e.g., C.O or CSRACC.O, etc.). The manual says "The file named in a FROM statement could not be located by the linker. This is probably due to a full pathname not being given for the file." Now, the error occurs with an unmodified project file, with no settings changed. It does not occur when I boot with a bare system; I haven't yet gone through the trouble of removing ACCs and AUTO folder programs to find which is causing the problem.

My normal setup is: TT, 4 megs each of ST and TT RAM, TT Hi, NVDI 4.11, Geneva 006, and numerous and assorted auto folder programs.

I will investigate some more, but would greatly appreciate suggestions or fixes.

>move or click of a button.
>Is it the 4 MB it has or does it need an accelarator ?

Depends on who you ask :-). If you're not happy with the speed.... I used an unaccelarated Falcon for a couple of years and the thing that bugged me most was the video refresh rate. Everything else seemed quick. Have you tried running it at a lower color mode? Try good ol' ST High just to compare with the ST.

If you find the screen redraw is the problem, you could get a video card like the Nova available from Homa Systems in Canada.

>Which are available and how much ?

There are lots available but Titan has made a very good name for themselves out of England. You might want to check them out.... I don't have the URL handy.

Hope that this helps! Good luck.

Sincerely,
Scott Tirrell

Go to the motu site to the UNISYN download area. All those profiles
will work on XOR! Once you download for the synth(s) you have and
unzipped them, just rename the main profile's extention to .XOR and
the help file to .HLP. Put them in the main directory of your XOR prg,
and use the configure editor to load them into Xor.

Hope this answers your question!

I really love XOR..very user friendly compared to Soundquest!(the midi
exclusive from Hell!...but thats MY opinion!)

Hello joska,

j> > Ah, I see, same mechanism as Windows on DOS I suppose ;->
j>
j> Erm... No.
What do I have to do more? Writing that this was a joke seem not to be
enough
though! =:->> Maybe next time I don't have to write it once, but maybe a
hundred times? =:-)

j> But it's just not so! A GEMbench-test (OK, it's GEMbench but that's the
j> only AES-benchmark I know of) shows that MagiC 5 is about 5% faster
than
j> N.AES when handling the AES itself. What does this mean in real life?
j> Absolutely nothing, zip, nada. You don't spend your time opening 50
windows
j> per second anyway...
I don't want to argue with any speed differences on the same hardware,
because it would take much time to give exact results (which I don't have
and
I'm not really interested in) and it is completly irrelevant, because the

"real" speed difference came from the different hardware you can use!

In January '99 the new MagiC PC version will be sold (hopefully). And it
is
two, three times as fast as the actual version 6.

Decompressing the archive of the actual ATOS archive (software based Atari

magazine) takes on a Milan 48 seconds, with a Pentium 333 MHz running the
new
MagiC PC the same job is done in 8(!) seconds (creating the archive takes
15
seconds).

Both hardware is sold to similar prices (at least here in Germany), so
even
if you just and only use ST software, you probably would better get a PC
with
MagiC . :-o

And MagiC Mac runs on a (more expensive) G3 Power Mac ten times as fast as

the actual MagiC PC on that mentioned PC and 3 times as fast as the new
MagiC
PC.

In fact, emulating a PC with Virtual PC on a G3, you got ST speed with the

actual MagiC PC.

j> Some practical tests I did a few months ago (for a magazine-article
that I
Maybe you can see now, what a real "practical test" is? ;-)

j> Papyrus, formatting HTML in CAB, recalculating a spreadsheet in Texel,
j> compiling C-code, compressing files and a couple of other things I
don't
j> recall right now was just about as fast on MiNT/N.AES, MagiC and TOS.
There
Of course, the more an activity just depends on the speed of the CPU, the

more the results get similar. That's nothing new at all ... =:-o

j> Relying to ASH-products is perhaps not the smartest thing to do,
because
j> when ASH drops their Atari-products we're all stuck with unsupported
j> products that we can't even fix ourselves. I'm not saying that
everybody
Yes, I will think about it if it drops ... ;-)

If you speculate, I can speculate that when MagiC gets dropped, it may
become
free, because the programmers are not businessman like Microsofties (no
chance to earn millions in the Atari market, or? ;-)), but Atari freaks.

But both are speculations and so ...

j> should drop MagiC in favour of MiNT, but praising MagiC and MagiC-only
j> applications as *the* best thing is shooting yourself in the foot. It's
OSS
I didn't harm any other system!!! (or tell me where did I?) Everyone has
to
decide on it's own.

But I please everyone, don't do to MagiC, what you want others not to do
to
MiNT/N.AES! If a MagiC fanatic would attack MiNT/N.AES with inproper
arguments, I just would argue for MiNT. I'm sorry, but that's the way I
am.
:-))

j> that will make our platform usable the next ten years or so, not ASH.
Sure, look at the mentioned speed of PCs and Macs, think and then tell me

once more, that in 10 years there is anyone working still on Atari-only
compatible hardware. Do I have to take that serious? Maybe, but I don't
think
so. Atari had the chance to be a powerful company in the computing market
-
they failed. I don't believe, that a much, much, MUCH smaller company will
do

it better.

Hello Martin-Eric,

qf> > AFAIR was MagiC the *first* possibility to surf in the net.
qf> Seems you would fail the "Atari History Test"..... *grin*
:-)) That's why I wrote "AFAIR" :-)

qf> > Yes. And to be honest, MagiC offered fast and TOS compatible
qf> > multitasking power at a point when MiNT stands just for "MiNT is
Not
qf> > TOS" (no word of anyway sucking MultiAES, no thought of N.AES
either).
qf> It might be a good idea for you to try N.AES before shitting on it.
Oh, come on. Where do I "shit" on N.AES? *WHERE?* :-((((

qf> However, MultiTOS works fairly well. Heck I even used it on my STE,
qf> before I got myself a TT.
Same as me (I really hated MagiC). I had it since version 2, but I only
used
MultiTOS, first on my TT, then with my Janus Atari card in my P100,
switching
to MagiC at the moment I got a faster PC, because it was much faster than

anything else.

qf> 1) no english programming docs available
qf> 2) english versions released 1 year after the german one
qf> 3) latest magic Mac/PC still not translated to english
Yes, that's really bad (but on the other hand, most of the time, a German

user has to cope with English software. So it's just the other way round).

qf> However, MiNT stuff is Opensource, so people can actually do
qf> something about bugs they find.
Yes, that's great! But it would be better even to have a MiNT/N.AES
version
running directly on PC or Mac hardware, using all the features that these

machines have (see my other mail).

I don't have to tell about the speed differences of TOSBOX compared to
MagiC
PC, do I?

qf> Personally, if Magic was Opensource also, I just _might_ make
qf> the switch, but ASH is too stupid to understand the power of
qf> the Opensource philosophy, so......
Hmm, Opensource is easier with C, than it is with assembler (although

everything beyond the MagiC basics is C, but ...).

Anyway, MagiC is just a commercial software. You can buy it or you can leave
it. At least, seeing that I get the fastest speed available for my Atari
software with MagiC (and I don't care on little percentages of difference,

there is a really big gap), I decided to buy it, because first of all, it

makes more fun, second, I use my "Atari" for business and as faster the work
is done, the better for me! :-))

Hello joska,

j> Katherine "abuse" the selected-flag on some objects to create a rather
j> cool-looking 3D under standard AES 4.x. Under MagiC it's possible that
j> these objects are interpreted differently, perhaps this is what you're
No, the RSC looked just the same on MultiAES and MagiC. I tried different

colour-depths, but not TC

j> > qf> cannot be expected anymore; we _have_ to move on.
j> > I don't think that this is correct! "We *can* move on" is maybe the
j> > better way. ;-)
j> Well, those that don't want to move on doesn't want new apps anyway, so
why
I thought about a programmer, not an user. Having a new system call, it is

good if you can use it when it's needed.

But if it's not really needed, you don't have to use it. Maybe you can
stay
backwards compatible, adding the new function for better results on newer

systems. If that's not possible, sorry about the "old" user. Nothing to
bother about (IMHO). But using new features because they are just new (and

this way you can interpret "_have_ to move on") is maybe not the best way
in
my view.

j> I have been using CAB with MiNTnet for about three years now, how long
has
j> I-Connect been available?
Sorry, I don't know. Just using Netscape for that since years (faster and

capable of JavaScript, Java and Plug-Ins).

j> I'd like to see some benchmarks comparing a Hades060 and MagiCMac on a
j> G3...
The Hades doesn't have a chance.

In a GfA group someone posted a small (and not a good) benchmark, but it
maybe give a little overview (cutting the results of monochrome if it's
possible):

```
------------------------------------------------------------
t#=TIMER
FOR i%=1 TO 100000
y#=25*463.752
NEXT i%
```

```
PRINT "Test 1"'TIMER-t#
t#=TIMER
FOR i%=1 TO 10000
PRINT AT(10,10);"Benchmark"
NEXT i%
PRINT "Test 2"'TIMER-t#
```

PB 190 (68040/66), MagiC Mac (not clear whether this are the results of a
compiled or interpreted benchmark)

Test 1 = 261
Test 2 = 805

(the following are all the results of the compiled benchmark)

Hades 040, NVDI

Test 1 = 43
Test 2 = 1314

F030 und NVDI
CPU/18MHZ CPU/36MHZ
Test 1 = 47 34
Test 2 = 2122 1902

TT, TOS 3.06, NVDI4
Test 1 = 60
Test 2 = 1623

AMD K6, 233 MHz, MagiC PC 5.2, NVDI PC

Test 1 = 16
Test 2 = 597

AMD K6, 233 MHz, TOS2Win 1

Test 1 = 18
Test 2 = 977

AMD K6, 233 MHz, TOSBOX (W95, no NVDI)

Test 1 = 55
Test 2 = 2387

Q660AV, MagiC Mac (265 colours)

Test 1 = 13
Test 2 = 1027

Mega STe, PAK68/3 50 MHz FPU and FastRAM(?)

Test 1 = 72
Test 2 = 2313

I'm sorry but I have lost some results, especially the G3 one.

I just remember, that Test 1 was *much* less than 1 second, the user had
to
go to the routine ten times to get a postable result. :-o

Maybe you can add Hades 060 results? But as you see, if the 060 is as
twice
as fast as the 040, it can compete to an (in the meantime) "outdated" PC,
not
a chance against an actual PC (and in addition the faster new version of
MagiC), not a single chance against a G3, which is ten times that fast
(three
compared to the new version).

PS: Beware of the fact, that the timer is slightly running slower under
MagiC
PC so you maybe have to add a little bit on those machines.

Greetings, Oliver

We are Microsoft - Resistance is futile!

Hello DarkChyld,

t> Its just my humble opinion but I find that hard to believe. I think
it
t> would be of greater benefit to all TOS users if the hardware
developers
t> and software authors catered to the users who are focusing on newer
t> machines (clones/highly upgraded Falcons/TT's), and encourage those 1
meg
t> 1040ST users to upgrade. (make them drool over the new stuff). ;-)))
The problem is: There are IMHO not enough users to develop a competetive
and cheap Atari clone.

THe Hades is maybe somewhat competetive, but not cheap. The Milan is
cheap,
but not nearly competetive.

Hey, I am a really big Atari freak, starting with the 600 XL, having an
800
XL, 130 XE, 520 ST+, TT, Jaguar and Portfolio since than, still using
Atari
software for private and business use.

But I can see, I can calculate and I don't close my eyes in front of the
reality (and I was always "open minded", using even in earlier times Mac
and
PC software, but on software or hardware emulation with my Ataris :-))

If you want MiNT/N.AES or anything like that to have a really good future,

the programmers should make them available on Intel and Power-PC CPUs, not

using TOSBOX or something like that, but to run "native" somehow, direvtly

using the host system, like TOS2Win does for example (or just better,
completly replacing it ;-)).

I was also a surprised at how sluggish the standard Falcon could
seem. Try not to use 256 colour mode unless required for graphics,
get NVDI, oh and if it has MultiTos installed flush down toilet.
Titan have the Nemesis accelerator for about 60ish pounds (not that
easy to fit i'm told). They also promise the Tempest accelerator will
be available "now" for about 200 pounds.

Hi Chris,

I have ST Fax 2.20 and use it via Magxdesk(Magic 5.11)and also
use STinG.(have the serial cpx set to 57600)I scaned & faxed some
documents today and didn't change any settings that I normally have
for STinG. Faxes today arrived perfectly. I think the init string I
have set in ST Fax may have something to do with it. I know it resets
my modem(SupraFax 288 upgraded to 33.6) I'm not sure that you have to
change the serial port settings.

If they were not such businessmen, then maybe they would stop
acting like they hold the future of the platform and maybe they
would collaborate a bit more with coders/users, by releasing
proper programming docs and fixing reported bugs, instead of
blaming it on Geneva or N.AES.

Heck, if the Atari market is so small, they should make MagiC
into an opensource project, like Mozilla.

4794. Calamus SL'98 display problem

Newsgroup: comp.sys.atari.st
Date: 1998-12-19 00:00:00 UTC
From: derryck@TAKE.THIS.OUTcix.co.uk
Message-ID: <75fva9$h5i$2@newsreader4.core.theplanet.net>
Source record: 88144

Is anyone else having a problem with the above (on a Falcon, 256 colour mode)?

Scrolling the window up or down results in the page contents smearing extremely severely or else they're redrawn incompletely with either top or bottom missing. About the only way that I can get the page restored is by using MagiC's "tidy screen" to force a redraw.

I can't lay the blame at anything else - this happens even on a clean boot and I've tried various copies of the falcon8.prg that are at hand in case of corruption.

It's also not always using the right pallette when loading a page!

Thanks for any help...

4798. Wavemaker 2.0 for the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1998-12-20 00:00:00 UTC
From: wavemaker@my-dejanews.com
Message-ID: <75hkru$1g5$1@nnrp1.dejanews.com>
Source record: 87954

I've just finished the second version of a program I've written call Wavemaker. This program creates waveforms for the Kawai K5 and K5000 synths. It uses several methods to do this including FM synthesis. It is a GEM application that should run on any Atari ST with a monochrome monitor. The program is freeware, so if you would like a copy just e-mail me. There is also a PaCifiST version to run on the PC.

Special thanks to Guy Harrison for helping me compile the program with Laser C. With out his help it's doubtful I would have finished it.

I got the August 98 version of SL98 and haven't run into too many bugs yet other than a glaring one in copying objects - the horizontal and vertical offsets are interchanged! What's this about registering with invers as opposed to MGI? What other bugs are there in the MGI version and what was the cost to register with invers?

How is it possible to abuse an Atari defined flag?? Atari itself defined
how a selected 3-d object should be drawn. So, how can it be abuse to set
this flag to gain the *Atari* standard selected 3-d object look? MagiC
claims to confirm to the AES 4 specification, which it does not!

>
>Atari has specified several flags in OBJECTs as user-definable, why couldn't
>she use those ?

Well this is another matter in which MagiC does not follow the Atari
specification. It draws selected objects differently, draws
the 3-d border differently and so on. I had to write my own object drawing
library so that the look of my program stayed the same on different OS's.
Now, if MagiC had followed the Atari specs, I would not have to do this.

>
Well, finally got it going OK in TT-med, even running TC on the card.
Had something to do with the Newdesk.inf I guess, been fiddling around
with it and now it boots OK.

Even with Gem.sys it doesn't look all that slow :-), the only thing is I
have no access to my CD-ROM drive now. Well, that's for later. (Come to
think of that, probably because Spinmagic.xfs was in the Extensions folder
and it should go somewhere else). Another thing, now I don't have MagiC to
set my systemfont, I use VDIfont prg again to set the systemfont to the
Rufus one. Guess what, it's displaying the ISO MSB PC-8 type again, not
all that bad, but it specifies the Rufus one in the cnf file...

So now I set it up running from the regular C:\ drive with all the gear
going (except for all the MagiC specific stuff, so I lost the Multistrip
taskbar etc), next I'm gonna try running XaAES with the Bar.app again.

So for the time being, my X-mas holiday is filled again :-)

>What makes me still loving it?
>Those are the questions, probably too hard to answer.

For me, the great thing about Ataris is that they are open and honest machines. You can understand what's going on and apply normal reasoning to sort out problems. They give you a fair game.

PCs, OTOH, are opaque and so complex as to be practically illogical. This has all come about through the build up of h/w and s/w kludges which have been neccessary to keep this antique architecture moving forward with the customers.

When you solve a PC problem it is usually by accident rather than reasoning. I don't find this satisfying AT ALL. OK, I've beaten it into submission but that's not in my nature.

>This is a very important thread in case you were wondering, or not
>realizing. It is the future of atari,

The difficult part of your argument is this, Kath. Is it better to retain SOME Atari involvement via Magic-PC or, as happens with some people, lose them altogether if they go pure-PC?

For Cubase Audio the Internal/External SCSI drives are O.K.
But for Soundpool's Audiotracker and some other programs
I want to connect a big IDE or EIDE Hard Disk.Is it possible
to make an extension from Falcon's original Atari case to an
external IDE? The IDE/EIDE could take power from an external
PSU because the internal is a bit on the week side.Inside the
C-lab Falcon lies a SCSI Quantum 514MB 2,5".
Thanks very much,Tony.
Atari lives everywhere >;).

Hi,
there are several boxes available that connect to the DSP-port and
provide analog inputs, outputs or a combination of those. Even with
balanced XLR in- and outputs for professional soundprocessing. And
I think there is a Falcon FDI (Falcon digital interface) that
connects to the DSP port and has digital outputs (coax and optical).
Connect that to for example a DAT recorder and again you have analog
sound. In this way you also work around the eq and level problems in
the Falcon analog audio output.
Good luck, Joost.

Was is the correct word to use, Frank's new FAT/FAT32/VFAT FS is a
lot faster than the built-in GEMDOS.

> You've tested

[...]

The point is that testing real applications is the only thing that
says something sensible about the environment you run them in. The
only thing it can say about the OS is how efficient the scheduler and
IO is. But the point is that the choice of OS has no real-life impact
on how fast *applications* do their stuff, so the old (and not
entirely correct) "MagiC is written in assembly and this is why it's
so fast (read: faster than other TOS-compatible OS')"-argument doesn't
make sense.

>> now was just about as fast on MiNT/N.AES, MagiC and TOS. There were
>> differences, but they were not consistent, some things were faster under
>> MiNT, some things were faster under MagiC and most things were fastest under
>> plain TOS.

> This result should have made you think earlier that you might have done some-
> thing wrong.

No, it just says me that some things are more efficient in MagiC than
MiNT and vice versa, and that most things are fastest under a OS where
they don't have to share cycles (TOS). This doesn't mean that TOS is
the most productive environment to work in...

>> Background-processes (like compiling large projects or
>> downloading/formatting html in CAB) was significantly slower in MagiC than
>> MiNT/N.AES, which atleast *I* find very annoying.

> Then why didn't you turn up the background priority ?

Because the MagiC-CPX crash my Falcon upon opening (it has done so
since I installed the Nova) so I can only use the default settings...
(No, I don't want to bother editing magx.inf, since I almost never use
MagiC anyway).

> Add TOS' Bios and XBios to MiNT, and you'll get an OS, but it's not hardware
> independent anymore.

Then MagiC isn't "a complete OS" either, because it doesn't contain drivers for all possible hardware. It needs separate software for harddrive-access, separate software for CD-ROM access etc. So if you define "a complete OS" as a piece of software that contains everything that's needed in one binary then you'll have to go back to old 8-bits before you find one... MagiC contains drivers for *most* hardware, MiNT contains fewer. Where do you draw the line between a complete and incomplete OS? Is a OS incomplete if it doesn't support my graphics-card without third-party drivers?

It's not a problem to write loadable device-drivers for every bit of hardware for MiNT, thus making it completely independent of TOS. But this will again require lots of effort in getting it to work on all the current and future clones. Just look at the huge efforts that's put into supporting new hardware in Linux, this would probably not have been possible in the much smaller MiNT-community.

> So that were a valid issue to be discussed, MagiC as being commercial against
> MiNT being free (open source). MagiC being "incompatible" against MiNT being
> "compatible" is just plain nonsense.

Well, MagiC is not 100% compatible with MiNT/MultiTOS (which undeniably *is* the last official standard from Atari), but whether this is a real problem is another issue. It's really a matter of how much effort spare-time programmers are willing to spend in reinventing the wheel to stay compatible with both systems. This, ofcourse, goes both ways, which is why Christian Felsch developed his GEM-lib with emulated MagiC-objects.

> And that's a different Ansatz compared to MagiC. MagiC reimplements them to
> make them nearly perfect. It depends on priorities. MagiC opts for a maximum
> of modern concepts in the OS, that's for instance reentrancy in all parts of
> the system, things that can never be gained with MiNT. It has the price that

Reentrancy will soon be a reality in MiNT as well, but it will require to move away from the old XDD/XFS-interface we MiNTer's critisized Andreas Kromke for not using ;-)

> improperly (i.e. not following Atari's specs) written software has more
> problems running compared to MiNT. Whether you're prepared to pay this price,
> is entirely your own decision, but it must not be used to call one of the
> two options worse than the other.

This is not correct, since MagiC still doesn't implement everything in
MiNT or MultiTOS. So you can still write 100% proper (according to
Atari's specs) software and get problems with MagiC. But if you're
talking about programs that access the (x)bios in a improper way
you're ofcourse correct. But this is generally not a problem with
anything else than old comms- and midi-software.

> Taking the most important task of an OS, access to filesystems, and taking the
> by far most popular filesystem (FAT), MagiC is "incredible fast" compared to
> MiNT, at least until very recently. I've heard recent MiNT has it's own FAT
> drivers, I've no idea how they compete.

Very well actually. Both peaks at 1.8Mb/s on my SCSI-drive, on the IDE
I got ~4Mb/s with both (HowFast). So on my Falcon it's the hardware
that sets the limits for file-access, not the OS.

> You do not do a fair comparision, if you optimise the benchmark conditions
> to suit best your favoured choice. Take real life conditions !

How more "real life" can you get than time actual applications doing
the same things under both systems? I can run some memtest and
GEMbench-tests and conclude that MiNT beats MagiC in every aspect
except the AES, but I know perfectly well that it's not so in real
life. But it *does* beat it when it comes to flexibility and
stability, which it why I immediately loved MiNT/N.AES when it finally
arrived.

> This proves that you should better not argue about MagiC in the first place.
> That is, if you really do not even know that the ratio of top app timeslice
> to background app timeslice is a user-configurable option.

I know that, but if I share cycles evenly between processes under
MagiC the top application get's slower than under MiNT/N.AES (atleast
it was so when I first started using N.AES, and ran some tests against
MagiC which I then loved so much), which is why I pointed out the
method that's used by MagiC to improve response has a great impact on
benchmarks.

A system where GEM-apps can be run under Linux is in development, but
this requires recompiled apps... This is not that bad though, when the
alternative is to emulate the 68k.

I personally dislike CPU-emulators intensely, the day I'll have to use
a emulator to run GEM-apps is the day I stop using GEM-apps
altogether... I have tested some emulators (GEMulator, MagiC-PC demo)
on my 374MHz CeleronA running NT, it's a rather slow and nasty system
which constantly blows up in my face. That's why I still use my Falcon
when I have to get things done.

Because they don't have any effect? AFAIK Katherine doesn't use
USERDEF's at all, she just sets the selected-flag on FTEXT's to get a
better-looking 3D-effect. I can't see that this should cause any
problems (according to another MagiC-user here it doesn't), since
FTEXTs supports this.

That's because it reads newdesk.inf. If you start GEM.SYS with it's
own desktop (that is, no 'SHELL=' in GEM.CNF), you can change
resolution just like in TOS.

> have no access to my CD-ROM drive now. Well, that's for later. (Come to
> think of that, probably because Spinmagic.xfs was in the Extensions folder

You must install SPIN as described in it's documentation. That means
SPIN.XFS in c:\mint or c:\multitos (if you boot from c), and MetaXBS
properly installed. I don't know if it's released yet, but later
versions of MetaDOS also supports MagiC6-style shared libraries.

Drop XaAES if you want to *use* it, it's still very experimental and
will probably stay so well into the next millenium...

I once found a utility called Hideaway which did something similar to
Multistrip (but with a very different interface) which worked under
MultiTOS. I believe it's on funet.

It's free, and I doubt there are any web pages with more info, but you
can ask me anything since me and my friend Bob have been running it
for years, plus you just gave me a great idea for my web page.

http://users.snip.net/~mhop

It's dedicated to our Atari user group meetings, and I put a few of my
favorite MOD files to download, plus some of my favorite animated
gifs, but now I can make a place for Fnordadel. I have sources and
binaries for version 1.33, and only the binary for version 1.35, all
on floppys at the moment. (It's an interesting story how this came
about, perhaps more appropriately told on the web page)

Give me a few days to put them up. With this busy time of the year,
maybe even wait till after christmas before I have time, but I'll do
my best.

4821. Need Help finding new SCSI power supply

Newsgroup: comp.sys.atari.st
Date: 1998-12-20 00:00:00 UTC
From: mhop@snip.net
Message-ID: <367d3d17.2240546274@news.snip.net>
Source record: 87977

My external Toadfile had two SCSI drives, one in each bay, when the power supply toasted. The power supply is a flat rectangle shaped circuit board with male pins for both power in and power out. Toad doesn't have those power supplies any more, even though they are standard 12v/5v which power standard SCSI drives (and the ICD interface). I can't seem to find a similar supply. The best I can find would seem to be the same kind in a PC case/tower. The 12v should plug directly into the SCSIs, and the 5v normally intended for the PC motherboard would go to the ICD interface. Is this as simple as it sounds, or am I missing something? Has anyone had this happen to them before?

Also, since the Toadfile is flat, the new power supply is square and won't fit, so I could take the drives and the interface out of the Toad and put them in the PC tower, but then I wonder if the interface DMA in and DMA out can fit in an external port slot.

From: dwmoar@spiritone.com
Message-ID: <914185554.234057@ridge.spiritone.com>
Source record: 87980

Ok I had this same system setup and running ok on the Falcon. when I connected it to the TT it started to boot and stopped at the HD Driver. I tried a reboot and than it came to the desktop and than froze when I tried to access a program. After that it wouldn't boot, when running HDDriver util from floppie it said no suitable partition found. I even tried to re partition - it said it was completed, but than when I went to write the hddriver to the partition it wouldn't do it. Early this morning it did boot, but it did it from the Zip drive. I check the ID's and got this

SCSI ID# 5.0 IOMEGA Zip 100 L.27
SCSI ID# 7.0 USeimet HDDRIVER Scsi Libary 3.02

ACSI ID# 0.0 Quantum ELS170S 4.3
ACSI ID# 1.0 Conner CP3300 - 360mb - 3.53236

No where does it even find my CD Rom set at SCSI ID# 4.0 or my Quantum 1.6 gig hard drive set at SCSI ID# 2.0

I can now get the system to boot with the exception of the CD Rom and the 1.6 gig disk, though it always boots from the zip disk.

By the way SCSI Bus Arbitration is set to on and the SCSI Initiator ID is 7.

Anyone got any ideas????? One question that I have is does the system try to boot from a scsi device before any acsi device if this is true that might explain the reason for booting from the Zip drive.

Hi,

I just was given a Canon Multipass C20 multi function printer.
It can print BW 720 x 360, color 360 x 360, fax, copy and scan.
IF I can get a driver for it for
- NVDI
- Calamus
- Papyrus
- Idealist

For now it does not react AT ALL to my Falcon. Could it be the
Canon Multipass C2O is just one of those devices that only can
live in a Windows environment (2way communication with Computer)
or can somebody help me to get some Atari drivers for it?

Greetings,
Jan

Same thing, gotta read a lot of docs again. But, like I said, that's for
later.

>You don't have NVDI?

Sure. But XaAES doesn't like it. Got NVDI 4.12 here, special Matrix
version. This one drives my card.
When I boot from the partition with the old Matrixdrivers, XaAES won't
have a problem running in TC, but since these drivers are crappy, the
widgets won't show up. Empty boxes, you know what I mean...
So, booting with NVDI, which avoids all these problems with some other
apps (like That's Write, Freedom etc) results in a messed up screen where
I can't work at all. Hence the need to skip NVDI on the card. Haven't
tested it with the old 'n faithfull 3.02 regular. Crappy drivers problem
then not solved either :-)

Well, I've been spending the weekend again. Fetched OAEsis too, got it
running in TT-med, also on the card but on the card that was about it. It
said it also loaded Thing, which showed up in the apps list, but it was
just an empty desktop with no menu's either. Anyway, in TT-med it did a
good job.
That is to say: Thing got loaded. Tried Graftool from Thing and it went
"poof!"... I guess it's not compatible yet... :-)

So that leaves Gem.sys the only usable AES then. Guess the first S/W I'm gonna buy in '99 will be N.AES...

Until then I'm back on MagiC mainly.... well, it ain't all that bad! :-)

BTW: I didn't expect the bunch of reactions on my initial complaint about incompatibility problems between Mint/NAES vs. MagiC... :-))))
Enjoyed the debate, that's for sure!

Happy holidays!

> Tell that to my Falcon. MagiC 5.11 works extremely well on it.

This has been debated many times. The problems does not occur on *all*
Falcons, but *many*. E.g. I have always had serious problems with
MagiC on my Falcon (if I could use it for an hour without crashes I
was in heaven), but my friend Geir Vï¿½lidalo claims to have no problems
on his (almost) identical Falcon.

It has been improved a lot, but I still have problems with 5.1x which
I use from time to time. On my TT and MSTE OTOH MagiC itself is very
reliable, but there's one thing I've noticed in many newer, German
apps and utilities: Callback-functions between applications, or even
worse, apps that installs callbacks in TSR's. Yuck! This is a very
nasty way to program, and it compromises the stability of the entire
system. It's not that bad in MiNT if you enable memory-protection, but
under MagiC (and MiNT on machines with no MP-possibility) it's a real
problem.

MagiC 6 is VERY stable on my 4meg STE :p

>So your Hades thing is irrelevant.

Why is it irrelevant? If it was so good, then it would be 100% atari
compatible. But it isn't, hence the need to make a special version of
Magic.

>

I did not say that, doh! I said atari compatible, ie supporting
everything, not Most things like it does.

>> then MagiC wouldn't need any modifications.
>
>Weird weird weird...

You are a MiNTOS user, as you say so often. You don't use MagiC on a
day-to-day basis. I have used Magic on a 4meg Falcon and a 4meg STE,
and both have been very stable. MagiC may not be the best OS around,
but I like it. It runs on all 16/32bit Atari machines
(ST/STE/TT/Falcom), but has problems on Hades. That to me says that
the Hades is not very Atari COmpatible. Ok, it runs a lot of atari
applications, but when you say Atari COmpatible, it should be atari
compatible. Not nearly compatible.

You can not blame MagiC for being uncompatible when the machine is not compatible in the first place.

Sorry if this is a bit confusing, I have tried as best as I can to explain it :)

>I guess a 1040 STE with magic is the killer machine then.
>

It works, brilliantly IMHO

Has anyone had any trouble concerning demon email accounts.

I've had my demon account for about 3 month now, and i recently just started using the email, only
to find out that my emails are not getting sent out.

I've set the correct servers, usernames and passwords, but still nothing.

Dave

Hey JoNK,

So welcome to the wonderful world of the IBM. Known for bloated
software and all the bells and crap. I have two of them a p-200 and an
intell 233. I still find myself always going back to my good OLD Atari to
do almost everything. There are a few graphical things that I do on the IBM
that I haven't figured out how to do them on the TT yet, but be asured when
I do the IBM will be the dust collector in the house

Nope - and yo should not either - I'll explain below...

>I've had my demon account for about 3 month now, and i recently just
>started using the email, only
>to find out that my emails are not getting sent out.

You mean you are unable to send out email? Or is this for receiving?
Anyway, for receiving, I did a test, fingered your account at the mail
servers and noticed no mail was waiting for you - sent a test message,
waited a minute or two, did another finger of your account on the mail
servers and saw there was a message waiting for you to collect
(presumably the email I sent out)

>I've set the correct servers, usernames and passwords, but still
>nothing.

Hmmm - would have been useful to provide some further info such as the
names of servers you are using...

OK, for starters...

SMTP server: post.demon.co.uk
POP3 server: pop3.demon.co.uk

username: eternal1
password: whatever it is

Other than that, just as a final check - when using the Demon mail
servers for sending, are you connecting via Demon to send the email or
connecting via another ISP?

Regards
Danny

Well, you don't mention SCSI or IDE, but I'm assuming you are referring to
an IDE, and the answer is yes.

If you are in the UK, you can try the IDE interface from TUS.

AM.

I think therefore I AM.

4838. FS: Huge ST computer setup or trade for Jaguar stuff...

Newsgroup: comp.sys.atari.st
Date: 1998-12-20 00:00:00 UTC
From: Frank Traut <save2600@ticon.net>
Message-ID: <75k53e$72d$1@galileo.ticon.net>
Source record: 87994
Cross-posted to: comp.sys.atari.st,rec.games.video.classic,rec.games.video.marketplace,rec.games.video.atari

My wife has spoken(she's been pretty good about my
hobby until now) and it's time to start clearing out some
of my video game stuffs that are taking up more than
their "fair share" of space.

This mega-gamers system includes an Atari 520STfm
computer that has been upgraded to 1 meg of RAM, an
Atari SC1224 color monitor, mouse and joystick. The
computer also has the 'Tweety-board' installed. This
device gives your Atari ST stereo out! Hook it up to
your stereo system to really enjoy the music and sound
effects that this computer has to offer.

Software wise, there are way too many to list. They include:

119 disks jam-packed with games from the Automation
catalog. You name it, it's on there.

Over 80 real (non pirated) games, most of which include
their instruction manuals. And they are different games
then what is on the Automation disks!

Over 100 cover & magazine disks(STart, ST Format, ST
Action, Compute!, ST user, etc).

Over 60 Public Domain disks packed with all sorts of
games, utilities, etc.

Lot's of real commercial utilities including: Word Perfect,
Doctor T's music software, Music Construction Set, Page-
Stream, ProText, ST Writer, Timeworks Desktop Publisher,
Epyx's Art & Film Director and Neochrome.

You easily get over 600 games to play on your Atari ST
computer!! If you have been looking for a setup like this
for yourself or for your kids, this is the perfect all in one
shot deal!

Everything looks and works great, with the exception of
a few games. Some refuse to load for some reason.
I am looking to sell it outright (you make reasonable offer)
or trade it for 'smaller' things that I "need". Below is a list
of all my video game wants:

2600

Backgammon - picture labeled cart
Canyon Bomber - picture labeled cart
Crazy Climber
Video Chess - picture labeled cart

Jaguar

Air Cars
Attack of the Mutant Penguins
Fight For Life
Flipout
Hoverstrike
I-War
Iron Soldier II cartridge or CD
Power Drive Rally
Theme Park
Towers II
World Tour Racing
Worms
Zero 5
Jaguar CD Player
JagLink Interface
(2) Jag Pro-Controllers

TI-994/A Cartridges

Beyond Parsec
Blackhole
Championship Baseball
Crossfire
Junkman Jr.
Meteor Belt
Micro-Pinball
Midnight Mason
Scrabble
Strike Three!
Topper

Sega Master System

Forgotten Worlds
Gauntlet
Ghouls N Ghosts
Golden Axe Warrior
Heroes of the Lance
Klax
Paperboy
RC Grand Prix
Time Soldiers
Ultima IV
Y's - The Vanished Omens

I'll trade my whole ST setup for any reasonable combination
of the above games. Serious inquiries only please...

Thanks for reading!

-Frank

Yet another beta CAB.OVL is available from my page.

I put in a small hack to get over a miscrosoft server
incompatibility with the RFC specs. (surprise there eh!)
This gets the graphics to come up on yahoo.

I also fixed a bug in the authentication routines. Should work
first time now.

The location as always http://www.netset.com/~baldrick/

As I really haven't used the English march release very much due the
problems I had with it I didn't know that. I just checked that. Indeed this
keyboard sortcut doesn't exist
>
>>I also know that the English version as provided by MGI contains lots of
>>bugs which has been fixed (more of the less) recently by Invers software
>
>Mine is by MGI with a March date.

For me this release was a nightmare. All kind of problems. Working longer
then 30 minutes without any crash was very rare.
>

>I've just downloaded this demo (dated August) and at least on first sight
>it's cured all these problems (there was another display bug concerning the
>built-in file selector which I haven't investigated yet).

With MiNT/N.AES the build-in FS causes a crash when I try to access
non-TOS partitions (VFAT, Minix). The same happens when I try to load
something from my CD-ROM
>
>I'd be happier tho' if I could get some support from the UK distributor.

Have you tried to mail Ulf Dunkel of Invers? He is a nice chape and above
all he speaks English reasonable well. Ulf_Dunkel@el.maus.de

>He's not responded to any of my emails and I do think that the problems make
>this (March) version unusable in colour.

My March release came also from an UK distributor. It have took just one year
before I got my ordered (and unfortunately prepaid) Calamus update.
March 1997 I ordered the Calamus SL96 update and finally got in March 1998
the SL98 update. All that time he responded only a few times my mail.

Yes the TOS in TT searches for something bootable going fron SCSI id
0 to 7.
So a bootable disk (with HDDriver) in the ZIP makes a good boot.
Put a non-bootable disk in it and TOS searches further on for a
booatble drive.

Hi again (and again, and again, and....)

Well, somuch for Mint plus Gem.sys

Got some steps further, changing the systemfont thanks to someone who kindly explained it.

Next Q: I added a line SHELL=C:\THING\THING.APP, but Thing won't run from it (well, won't start up automatically, that is. It sure runs from Gem.sys).

The thing is, perhaps I missed something in the P-I-L-E of info I got lately on installing Linux/NetBSD/Mint, but sofar I haven't found much docs on how setting up Gem.sys by means of the cfg file. Or perhaps explanation about use of keys with it? Etc.etc.etc.

Somewhere a place where extensive Gem.sys docs are available?

Another weirdo is the behaviour of Menuinfo 2.somuch, it displays 3200 kb ST-RAM and something like 4000 kb TT-RAM, whereas under MagiC it displays right figures and Mint during the boot says nicely it found 64 Megs of fastram. Anyone, again? (and again, and again, and...)

Oh, it does, you only need to interpret it correctly. But I agree it's hard
to provide true evidence.

That may be a valid reason to not use MagiC, but then you really should
not make any related statements.

> graphics-card without third-party drivers?

An OS is complete if it is selfcontained. It does not need to contain drivers
for every fancy hardware you can think of. Point is MagiC can run standalone,
from floppies for instance, and it can run applications (probably few complex
ones) in that environment. MiNT on the other hand, regardless how you start
it up, does not run without TOS low level parts (Bios etc). Note this really
is the point here. If you take all hardware dependent stuff away from a
complete OS, it may become hardware independent, but it certainly won't be
complete anymore, i.e. it won't run standalone on all hardware.

I believe there is no standard way to define "completeness" of an OS, so of
course you can define whatever you like, but you will find it hard to come
up with a definition that makes MiNT more "complete" than MagiC.

> Well, MagiC is not 100% compatible with MiNT/MultiTOS (which

It is for all programs (not necessarily system software of course) that
are written 100% according to programming specs released by Atari (I noticed
you stated something else below. I disagree). It is not for software that
violates those specs. This is a tradeoff you have to choose. Do you want
to run bad programs ? Then use MiNT/MultiTOS as its compatibility is greater,
but if you're ready to discard dirty stuff, then MagiC will be your choice.

BTW.: In many respects MultiTOS doesn't even itself live up to Atari's
specs ("bugs"). In those respects I'm quite happy with MagiC being

incompatible to MultiTOS, as it conforms to the specs. MiNT/MultiTOS
has never been an option for me, for MultiTOS mostly. MiNT/N.AES probably
is a neat thing, but since I'm very satisfied with MagiC, I hardly care.

> this is a real problem is another issue. It's really a matter of how
> much effort spare-time programmers are willing to spend in reinventing
> the wheel to stay compatible with both systems.

I never found it very hard to write my stuff such that on MultiTOS it only
fails where it encounters one of MultiTOS' numerous bugs.

> Reentrancy will soon be a reality in MiNT as well, but it will require
> to move away from the old XDD/XFS-interface we MiNTer's critisized
> Andreas Kromke for not using ;-)

Apparently (indicated by the smile) you have noticed that this is one of the
best examples, able to dismiss the criticism aimed at blaming Andreas for not
taking over certain MiNT standards. Andreas does not do this for nothing. I
once asked him for a variety of things why he did them different from MiNT.
For each he had very good reasons, like here where he noticed that the MiNT
XFS interface is an obstacle on the way towards full reentrancy (which always
was an important goal for Andreas). Hence he created one that's better suited
for reentrancy. Promptly, many users who did not bother to use their brain
blamed him for this, accusing him he invents proprietary stuff to divide the
Atari world, or for other silly reasons. People wonder why he shows up here
so seldomly. I don't.

I'll watch the MiNT development curiously. I really want to know, if the
MiNT people, who have so often shown contempt for Andreas not taking over
their XFS interface, will live up to their "higher" moral standard, and now
accept Andreas quasi-standard for a reentrant XFS interface. I somehow feel
they won't, I feel they will do precisely what they blamed Andreas for so
often : they will invent their own, incompatible XFS interface. They will
once again justify this by saying they are the chosen people (by Atari),
ignoring that MagiC had been recognised by Atari too. They should be ready
to accept the same blame that was originated by them before.

> This is not correct, since MagiC still doesn't implement everything in
> MiNT or MultiTOS.

Which is ? Try to point. You'll find it hard to find anything application
(meaning not system software) related. And don't come up with things like
"small background process priority".

I do not know recent versions of MiNT. Maybe there has been added something
that now has been "announced" to be part of the standard. MiNT is open source,
I can even add myself a feature and claim MagiC doesn't implement it hence
MagiC doesn't live up to the standard set by MiNT.

>> Taking the most important task of an OS, access to filesystems, and taking the
>> by far most popular filesystem (FAT), MagiC is "incredible fast" compared to
>> MiNT, at least until very recently. I've heard recent MiNT has it's own FAT

> I got ~4Mb/s with both (HowFast). So on my Falcon it's the hardware
> that sets the limits for file-access, not the OS.

I believe for any significant file size this would be the case, even for RAM disks, since the MiNT driver has probably seen some optimisation. Since I know Andreas' obsession with perfection here, I'd still guess the MiNT fs is slightly behind, but far less than should be relevant to any user, as it apparently is already hard to measure.

> the same things under both systems? I can run some memtest and
> GEMbench-tests and conclude that MiNT beats MagiC in every aspect
> except the AES,

Under the same circumstances ? Given your previous tests, I'd like to doubt this. Still, even if it is true, I'm sure the difference is in the one percent range.

Then, think what a memtest does ! It tests the CPU and other hardware, but not the OS. Then you only cite GEMbench. Someone said for every system you can create a benchmark program that makes the system look better than others. There is a lot of truth in it. Do several variing benchmarks, one is not enough. Note that designing good benchmarks is a science that is hardly understood by normal programmers. GEMbench is kind of a standard, but I've seen it give really ridiculous results under unusual circumstances.

> life. But it *does* beat it when it comes to flexibility and

Flexibility ? Due to the variety of software that has been derived from the GNU project. Without that software, I disagree.

> stability,

??? Used MiNT for a while, and it's stability was one of the reasons I moved to MagiC. MagiC is rocksolid, virtually never crashes without some software tearing it apart. I've heard it got some problem with some Falcons, Andreas claims Atari did something strange in them. Can't tell if there is any truth in that. MiNT crashed far more often for me, maybe due to it using so much unstable TOS code. If that's true, then probably it behaved better now with the new FAT fs.

> which it why I immediately loved MiNT/N.AES when it finally
> arrived.

Love it. Use it. But don't try to compare to MagiC if you hardly ever use the latter. From what you wrote above, you appear to not have seen any version after V3.0 or V4.0.

>> This proves that you should better not argue about MagiC in the first place.
>> That is, if you really do not even know that the ratio of top app timeslice
>> to background app timeslice is a user-configurable option.

> MagiC the top application get's slower than under MiNT/N.AES (atleast
> it was so when I first started using N.AES, and ran some tests against
> MagiC which I then loved so much),

I do share cycles almost evenly between foreground and background, the top application is quick and responsive even on a 8 MHz ST. In fact, makes me wonder if you had something else going on in that machine.

Cheers Peter

> Is there an english version of magic pc?

Yes, but it's at least a version behind the German one, unless System
Solutions have released v6 in the last couple of days.

BTW MPC 1.2 was followed by 6 (I think), there is no MPC 2, 3 4, 5: ASH
just harmonised the version numbers across platforms. v1.2 actually runs
MagiC 5.11. Same applies to MagiCMac where the jump is from 2 to 6, I
think.

> how might one go about remapping the keyboard - is this possible?

Don't really know about this one, but I have a vague recollection of a
freeware utility for this which would probably work.

Yes, but CAB has its uses too, particularly for authoring in conjunction
with Everest/OLGA.

> graphic, isn't photoshop enough for you that you need to run papillon or
> such?

And Photoshop costs how much? Maybe (not in my case, actually) you already
have a decent graphics package running on your Atari. MagiC PC costs less
than Photoshop...

> games, hmm games don't run in magic, and PC for games are rather
> interesting.

So games aren't the be-all and end-all. I was never a huge game-player on
my Atari anyway!

> Video? same, with all the applications available on pc/mac WHY the hell
> would you need aniplayer, or m_player or such, EVEN at a wonder speed..

Agreed, unless you want to use such programs while in the MagiC environment
when using other Atari programs. Which you might well.

> DTP, calamus under magic PC is really that much better than all the tools
> for win95? Quark express doesn't cut it, or even Calamus PC.

And how much does Quark cost, compared to MagiC PC? Factor of 10 times the
price in the UK. I have a fair few Calamus docs, not easily converted to a
PC program (esp since Calamus for Windows is discontinued, AFAIK).
Similarly Papyrus docs: OK, you can convert to RTF but then you lose some
layout stuff, pictures etc. I also use both Papyrus and Calamus for things
I can't do (or are a pain to do) with the Windows software I have (as so
far I haven't got any Windows DTP app).

> There are so
> many choice that to me, investing in a TOS emulator, NO matter the speed
> is worthless. Ask yourself why you use atari.

See your own reasons below. I use it cos I *like* it.

> The plan is this:
> 1 guy with a nice atari setup, pretty happy, gets his head filled up by
> some ASH, or whomever else that magic-pc will be the same if not better.
> And still they are considered atari users because they use magic-pc.
> The guy confidently, sells his TT/Hades to get a PC with magic-PC.

Try this alternative:

Guy with nice Atari setup, but showing its age. 4Mb STE, both mono and colour monitors, MagiC 5, Papyrus, Calamus, CAB, STinG etc etc.

Is getting interested in web stuff and feeling a little left behind due to CAB's lack of some stuff. Also getting interested in databases and there is nothing available (at least in English) to compete with the likes of Access, which he already uses at work. Twist just doesn't cut it. Also, wants a nice big colour screen rather than 640*400 mono or 320*200 in 16 cols.

Options:

1) Buy a Falcon, which is probably going to still be slow without an accelerator etc, and still have restricted net software and no reasonably powerful database app.

2) Buy a TT, but will need graphics card and still have the software availability problems.

3) Buy a Hades or Milan, cost as much as a PC but still software availability problems.

4) Buy a PC or Mac with MagiC and have the best of both worlds. In my case PC as there isn't a version of Access for Mac, and I actually *like* Access (yes, I know I'll get cast into the outer darkness for saying this here).

> What will happen next?
> 1) Most applications won't run as expected.

From what I can work out from reading posts from Falcon/TT users etc here over the last few years, things are probably no different to running programs on those systems. Particularly once you start adding in graphics cards etc to the equation. Some programs need different res settings etc. Not an insurmountable problem. Really awkward stuff probably got ditched a while ago as it wouldn't work properly under MagiC or MTOS on Atari hardware (*lights blue touchpaper...*). And on MagiC PC you can run stuff under TOS if you are really that desperate (never tried myself).

> 2) some applications will run VERY fast (raw power). Like whoao, it only
> took 11sec to compile this project.. When on my TT it took WAY longer, at
> least 2 min...

The difference is more marked if your Atari was an 8MHz model, as was mine.

> 3) The magic-pc users will invest his money where? in atari market or
> microsoft product?

But in some cases there is no Atari product to invest in, eg databases as I've mentioned above.

<snipped example domestic arguments...>

> Basically, The magic-pc user will use his old software because it is a big
> investement he has made over the years. But newer versions, you can be
> sure, the computing money won't go for atari applications"

Depends on the person and why they are switching. I still haven't ruled out upgrading some Atari software, as some is nicer than the PC stuff and it's also familiar. Also, there is the hobby aspect as mentioned below.

<snip>

> This is reality, unfortunately, I am sure the first intentions of
> magic-pc/mac are good. But in a long terms it doesn't help anything
> really. I am well aware that some people running magic-mac still code
> atari applications, and that is great, but is nothing compared to all the
> moves the users have been taking...

Which is more likely to result in continued use/purchase of Atari software? Switch to PC/Mac without emulator, or switch to PC/Mac *with* emulator? The users may well end up moving anyway: if they can still use Atari software under emulation, so much the better.

> Which one of those people is more an atari user?
> - a guy running NETBSD on his TT030?
> - a guy running magic-mac on his G3?

In software terms the latter. Will using NetBSD result in another Papyrus sale?

> Hardware versus software.
> WHat makes atari fun?
> What makes atari attractive?
> What makes me still loving it?
> Those are the questions, probably too hard to answer.

That depends on the individual person, I think. No one solution will fit all, it depends on what you want to do. I chose my way, and it suits me. Your way is different. Neither is better for the other person.

> Please, take a look back to the whole situation we are going thru.
> Then put a message in this very same usenet group to all discuss.

Your wish is my command!

> This is a very important thread in case you were wondering, or not

> hate it, Just that there is NO need. Home-computing is a hobby,
> some people collect beer bottles, some other stamps, me, you guessed it
> is

> computing and music.

One very important reason for me in using MPC is that I can still use my Atari stuff: I *like* Atari stuff in a similar (though obviously not identical) way to you.

> Please, do not ruin my hobby by taking away the few users there are left
> already, I won't have the pleasure to share my passion with
> anyone else anymore...

Who's taking anyone away? I've moved over to MagiC PC, but I'm still here and not cackling evilly while trying to lure anyone away from whatever they are happy with. Others have moved to MagiCMac, Hades, Milan or whatever else suits them. Or (the majority, probably) stay with their Atari hardware.

The number of postings here dropped quite sharply a while back (which worried me at the time), but has remained fairly steady lately, so either people are hanging around or those of us who are left are talking a lot!

Hello all,
well you may (or not) have noticed that the MagiC page has not been updated for quite a bit of time. This is due to the fact that I am totally re designing them offline, updating and adding information (I had quite a bit of information that was not 100% true up..) and should all be up and running in a nice new chiney package soon,
regards,
Bengy

If this is the case then the first release of Magic should have also
worked on the Falcon. But, as I remember (because I had to wait for its
release) Magic wouldn't run on a Falcon until it got to version four.
So, is this really any different?

Regards,

Ben Hills.

I'm sorry to say this, but you're talking pure crap here. If the Hades should be 100% Atari-compatible in your sense (or should I say 'MagiC-compatible'?) it would have to be 100% compatible with the ST *at the hardware-level*, which AFAIK no clones are (not the Falcon either). By your logic the even the Falcon was Atari-compatible until MagiC was adapted to it...

> but I like it. It runs on all 16/32bit Atari machines

> compatible. Not nearly compatible.

You are aware that MagiC has to support the STE, Falcon and TT specifically? They're not just faster (or more colourful) ST's, they're all very different from the basic ST. If things were as simple as you put it, MagiC would only use ST-resolutions, the YM-chip and not more than 4Mb on all machines, including the most souped-up Falcon or TT. MagiC needs to support the Hades hardware, just like it must support the TT or Falcon hardware. It's not a question of the hardware being compatible or not, but a question of hardware-drivers.

Btw. MagiC runs on PCs and Macs, does this mean that PCs and Macs are more Atari-compatible than the Hades or Milan?

What is wrong with my PC? I have a fairly OK PC (374MHz CeleronA, 128Mb RAM, 8Gb bloody fast IBM-disk, 4Mb S3 graphics-card) running NT4sp3, and MagiC-PC (I've only tested the demo) really, really suck. I mean it's so crappy that it's totally unusable. The screen-updates are not only slower than my old Mega ST running plain TOS, they're also extremely jerky. Even the mouse-pointer moves like Windows on a 286. The bloody thing bombs on me all the time, even with clean stuff like ST-Guide and qed. Compiling with Pure C is slower than on my TT.

The PC really flies compared to other PCs when running native stuff under NT, but MagiC-PC is a no-no. Same with GEMulator, it's too slow to be even remotely usable. I guess I'm doing *something* wrong, but what?

There is such a flag, however it doesn't make any difference sadly.

>If this happens all I can do is use the keyboard shortcuts to save the
>work and quit the Calamus.

That's another odd thing. If I use the [ALT] Q shortcut to try and quit, the
help message window flashes up "help messages on/off" - this particular
command has no keyboard shortcut assigned to it!

>I also know that the English version as provided by MGI contains lots of

Thanks for this information.

>Maybe you should try the latest demo version of Calamus SL 98 to see if
>the problem still resist. The English version can be found on the homepage
>of Invers software Vertrieb. You can find the URL on the UTSI page (see my sign off),
>follow the Text/PAO link

I've just downloaded this demo (dated August) and at least on first sight
it's cured all these problems (there was another display bug concerning the
built-in file selector which I haven't investigated yet).

I'd be happier tho' if I could get some support from the UK distributor.
He's not responded to any of my emails and I do think that the problems make
this (March) version unusable in colour.

You mean XaAES messes up the screen when used with NVDI on your card?
How, exactly?

>>Drop XaAES if you want to *use* it, it's still very experimental and
>>will probably stay so well into the next millenium...

beta7+ works reasonably well for me, but there are of course bugs.
Unfortunately, noone seems interested enough in the program to even
report bugs these days (I only recall hearing from one person about
beta7+, but there might have been two or three...).

The recent posting on this newsgroup from someone who was interested
in working on XaAES was nice to see, but I haven't heard anything more
from him yet. If only one or two more people got involved with the
actual programming, I'd definitely be more active myself.

In any case, I'll do my best to upload the latest XaAES beta7+ binary to
my ftp site before Christmas. This one has no problems with the Lattice
dialogs, which (IIRC) was still a big problem with the source release.
(I would have uploaded it yesterday, but I found a new strange problem
that I'll at least try to do something about.)

>So that leaves Gem.sys the only usable AES then. Guess the first S/W I'm
>gonna buy in '99 will be N.AES...

I refuse to buy either MagiC or N.AES, so I'm stuck with MultiTOS and
XaAES. Fortunately, the former is not too bad with an AB040 and the
problems with the latter don't bother me too much.

Anyway, I actually use SingleTOS 4.04 most of the time.
Mainly that's because I don't really do anything besides programming
on my Atari (seldom have, in fact ;-), and debugging fVDI is easier without
involving MiNT. If the compile/link had taken a long time, I would have
wanted to work on something else in the mean time, but it seldom takes
more than a few seconds.

What video mode are you using ? Are you running MiNT/MagiC or just TOS?
What AUTO programs or ACCessories are running?

If you switch to the ST video modes, it should appear faster than an ST,
otherwise
you might have a hardware problem.

You need to switch over the drive ID jumper from 0 to 1 (or the
opposite).

If there is no jumper, then it soldering time, and messing around the
drives PCB
to find a solderpad equivalent to the jumper.

My wife has spoken(she's been pretty good about my
hobby until now) and it's time to start clearing out some
of my video game stuffs that are taking up more than
their "fair share" of space.

This mega-gamers system includes an Atari 520STfm
computer that has been upgraded to 1 meg of RAM, an
Atari SC1224 color monitor, mouse and joystick. The
computer also has the 'Tweety-board' installed. This
device gives your Atari ST stereo out! Hook it up to
your stereo system to really enjoy the music and sound
effects that this computer has to offer.

Software wise, there are way too many to list. They include:

119 disks jam-packed with games from the Automation
catalog. You name it, it's on there.

Over 80 real (non pirated) games, most of which include
their instruction manuals. And they are different games
then what is on the Automation disks!

Over 100 cover & magazine disks(STart, ST Format, ST
Action, Compute!, ST user, etc).

Over 60 Public Domain disks packed with all sorts of
games, utilities, etc.

Lot's of real commercial utilities including: Word Perfect,
Doctor T's music software, Music Construction Set, Page-
Stream, ProText, ST Writer, Timeworks Desktop Publisher,
Epyx's Art & Film Director and Neochrome.

You easily get over 600 games to play on your Atari ST
computer!! If you have been looking for a setup like this
for yourself or for your kids, this is the perfect all in one
shot deal!

Everything looks and works great, with the exception of
a few games. Some refuse to load for some reason.
I am looking to sell it outright (you make reasonable offer)
or trade it for 'smaller' things that I "need". Below is a list
of all my video game wants:

2600

Backgammon - picture labeled cart
Canyon Bomber - picture labeled cart

Crazy Climber
Video Chess - picture labeled cart

Jaguar

Air Cars
Attack of the Mutant Penguins
Fight For Life
Flipout
I-War
Iron Soldier II cartridge or CD
Power Drive Rally
Theme Park
Towers II
World Tour Racing
Worms
Zero 5
Jaguar CD Player
JagLink Interface
(2) Jag Pro-Controllers

TI-994/A Cartridges

Beyond Parsec
Blackhole
Championship Baseball
Crossfire
Junkman Jr.
Meteor Belt
Micro-Pinball
Midnight Mason
Scrabble
Strike Three!
Topper

Sega Master System

Forgotten Worlds
Gauntlet
Ghouls N Ghosts
Golden Axe Warrior
Heroes of the Lance
Klax
Paperboy
RC Grand Prix
Time Soldiers
Ultima IV
Y's - The Vanished Omens

I'll trade my whole ST setup for any reasonable combination
of the above games. Serious inquiries only please...

Thanks for reading!

-Frank

4882. Re: Magic PC propaganda.

Newsgroup: comp.sys.atari.st
Date: 1998-12-21 00:00:00 UTC
From: paul.williamson@zetnet.co.uk
Message-ID: <75l8q5$e6v$1@roch.zetnet.co.uk>
Source record: 87917

Hi all,

I have been reading lots of things about the pros and cons of MagiC PC. Can someone tell me if it is yet possible to run a programme like Cubase, which uses a dongle in the ROM port, on a PC with MagiC ? If it cannot be done, then many of us will never have the option of using MagiC PC.

As to the future for Atari programmers, I have one request. Please - keep it simple :-)) Why ? Well the only real disappointment for me when I got the Hades was the need to start fiddling with "Inf" files, it suddenly seemed like a PC :-(((I really enjoyed the simplicity of my Mega ST, and more importantly, every time I went to use it, it worked and I spent my time productively.

For me, the computer is a tool that should do a job. I would not want to have to re-configure my motor car before I can drive it, or even have to work out which of the various accessories I have added cause it to crash every 10 minutes or so !!!

For example, I really should get on and change from Newsie to Okami, but all the posts I have read on this subject make it quite clear that I will need lots of spare time to do it. Why, I wonder, do I need to have 3 programmes to make it work when Newsie (almost) does it in one ? Why will I have to use a text editor to change various inf files, is it not possible to organise this through preference menus etc. ?

I know that many of you on this group really understand your computers and seem to find it quite easy to get to grips with this sort of configuring, but there must be plenty of others who, like me, enjoyed the fact that the huge benefit of an Atari over a PC was the fact that it did not have to run "Windows". It did not have another operating system in the way. It just had good, functional software that worked every time.

I know that we cannot stand still, and users (me included) want new software, but please, make it easy to set up and use.

Cheers

Paul

>You mean XaAES messes up the screen when used with NVDI on your card?
>How, exactly?

Hej Johan,

well, first of, I use the test6 version. The only one that works at least usable. Been testing it before on Mint 1.12 somuch, now it's on Mint 1.15. somuch. Well, what happens is the system boots, and when XaAES loads I end up getting some kind of ST-Lo display, with all multiple items: all in all I counted 6 (or 8?) mousepointers, which all didn't do what they should have done. I had this problem too with NVDI running from a former H:\ partition, and I talked to Wilfried Behne about it and he said is was probably because of NVDI booting NOT from the C:\ drive. So when I reinstalled on C:\ the problem had gone.
With XaAES it's back again, it should be in 832x624x24, but looks like an ST-Low rez with only white, red and black. Using it with the Matrixdrivers is OK, although the widgets won't show up (that is, not all of them). Same problems happens with Freedom, where the icons turn into a crappy mess. This seems to be a known problem with the Matrix drivers.
>

>involving MiNT. If the compile/link had taken a long time, I would have
>wanted to work on something else in the mean time, but it seldom takes
>more than a few seconds.
>
I hate singletasking these days... unless I have to, I won't use it.
BTW, running Mint + Gem.sys (which is AES 4.10) surprised me by the speed
it produced. I had expected much slower performance... The only thing I
don't like is I'm back on the bloody Atari systemfont in the menu's, boxes
etc. VDIfont.prg won't work because it modifies the AES, and so does
Gem.sys, and it won't work with Gem.sys (haven't tested it extensively,
but I wouldn't be surprised - I just could try by running it behind
Mint.prg.

Another strange thing: last time I tested (august, september) XaAES test6,
I found that it only worked by resetting program flags to "memory shared".
These settings led to problems running under MagiC. Now I just switched to
Mint again and I didn't have to reset all these flags... could be it's
because of the newer Mint version?

Happy holidays,

>spent my time productively.

Hi Paul,

you're probably not the only one... First, I think I should say that the
days of the 1040ST on a monochrome monitor (or a color one, or both) are
gone. Sure, there are probably thousands of them in use, or being used
like that and I even don't wanna know how many of them still operate from
TOS 1.02 or 1.04... Flick the switch and you're up an' running. Lots of
these sets might still just run from floppydrives too :-)

I'm glad it's 1998 and the hardware has gone up. For some others that
count's about the same, for yet others it's not a must. For me that means,
MT OS, better rez, more colors, higher speed, adding of CD-ROM drives,
more diskspace (Gawd, I wouldn't have believed in 1990 that I would be
running out of diskspace with two 850 meg drives!)...

So, also the S/W have come up. Which means more configuring, settings.
Some keep it simple (click the buttons, save settings, done). Others don't
or simply just can't, so it means editting INF, CNF, DAT, whatever files.
It always means: READ THE F..... MANUAL! But I still like the Atari,
because it's transparent, logical. Use a wondermachine PeeCee and try to
find your way thru' all those DL files, messed with by the OS at random
and you never know what's what, where it has been moved to/deleted
from/messed around with...
>
>For example, I really should get on and change from Newsie to Okami, but

Well, setting up Sting ain't that simple either: edit CPX'es, CFG and INF
and default files... once it runs, you just leave 'em alone. It needs
extensive docs, though, AND careful reading. Same with Okami. OK, one
could add mail/news fetching/sending to it, but it wasn't designed to go
with POP/NEWSwatch, it just happens POP/NEWSwatch can work with it.
Besides, this leaves the option with the user to decide how he/she wants
to use it. I think the setup for Okami could be simplified into a Gemmenu,
but it would probably need a rewrite of the program.
Ever worked with a mailer/pointsystem? Took me days, to set it up here,
and that was with a largely predefined config already...
>
>I know that many of you on this group really understand your computers

>
>I know that we cannot stand still, and users (me included) want new
>software, but please, make it easy to set up and use.

I don't think programmers make it more difficult than necessary, but
keeping pace to modern possibilities (more colors, MT environment, VA-
stuff etc, which in the end leads to a very nice-to-work-in environment),
just DOES complicate the whole stuff, including setting up.

If programmers hadn't adjusted to modern concepts, we'd all be sitting
using a 1040ST, SM124 and a stupid daisywheel printer, without Internet
using First Word 1.0 (which needed a separate printer program) etc. etc.

The main issue remains: Programmers, please write docs that users can use
and configure their software with. Whether that'll be using GEM-buttons or
editing INF files, doesn't matter that much (IMHO)...

Happy holidays,

Hi Jim,

That's a really useful site, there's loads of stuff there - thanks :-))

By the way, if anyone is looking for Cubase in small ads, I have found
that with most ads if it just says, "Atari + Cubase" or whatever, then
it is usually a cracked version. If it is a genuine copy with manuals
and dongle, it usually gives more details.

Hmm :)

GEM.SYS (Atari MultiTOS AES 4.10) does not modify the ROM AES.
It completely replaces it. No part of SingleAES is worth using
in multitasking environment (yes, I know about NOHOG.ACC).

Then, same about MiNT. Released versions still have TOSFS driver
compiled into, so anyone can say that MiNT is "a part of GEMDOS".
However I am currently using a kernel that doesn't use any part
of old GEMDOS. So, MiNT is GEMDOS for me and for you will be
soon too ... ;)

Yes. You're using MPC. :)

Okay, that was a joke. I had similar experience however (I tried the
demo) on
P100/32 MB/1 Gig disk/S3Trio V64+ (no, not mine... I have better things
to spend
money on; it was a computer at my workplace). The doc said something
about
MPC being 3-5 times faster than a TT on a similar machine. This turned
over
to be a bullshit. The MPC hardly surpasses the speed of my Falcon on
that P100.
The screen redraw is incredibly slow. The thing emulates only 68000,
which
makes it hardly useable for me. The thing doesn't run MiNT, which makes
most
of my daily software unusable. The thing crashes badly and it isn't even
able to do a reboot properly (there's funny mess on the screen when
doing auto).
Finally, the thing doesn't read/write floppies properly.

So I dropped the idea of MPC and, while I wanted to have an Atari
compatible
computer at my workplace, I bought a TT030. It did everything I wanted,
i.e.:
- ran MiNT
- ran gcc
- ran MiNT Net and was accessible remotely (via telnet)
- provided simple user services for my friends
- was running 24h/day.
- was _fast_ and had a 68030/68882, which is a basic setup for me.

Happy New Year,
Draco

<kellis@leading.net> wrote:

>And still they are considered atari users because they use magic-pc.
>The guy confidently, sells his TT/Hades to get a PC with magic-PC.
Well personally I have a Afterburner/Nemesis equiped Falcon sitting on
the desk and a TT on a small table beside it. Now I have no intention
of selling either machine despite the fact that I do use PC's more
these days than the Atari, I just rate the Atari environment over the
PC.

>1) Most applications won't run as expected.
Yep, I experienced that when I bought an Apple Quadra 840av and
MagicMac (v1.05) as a replacement to my 14Mb Falcon. I wanted a faster
setup but few of the apps I used could be persuaded to run properly.

>2) some applications will run VERY fast (raw power). Like whoao, it only
>took 11sec to compile this project.. When on my TT it took WAY longer, at
>least 2 min...
They did but to my mind the disadvantages outweighed the advantages. I
ended up selling the Quadra and MagicMac and used the proceeds to buy
a 20Mb TT with Matrix TC1208e graphics card and 20" monitor. It was
only later I upgraded the Falcon with Afterburner/Nemesis for more
speed (though TBH I regretted it as I have never been 100% happy with
the machine since and went back to the TT).

>3) The magic-pc users will invest his money where? in atari market or
>microsoft product?
Oh PC of course ;-)

But to take another stance. I purchased a number of Atari items off
Image Applications (Calamus SL upgrade, Bridge module, etc) and have
had constant hassle with the companys lack of customer care, product
supply, etc. Here I am over two years after the original order and I
am still owed much of the order. I will shortly be taking this through
the small claims court!

Another view is that I recently contacted System Solutions about some
upgrades (NVDI Matrix v4 to v5, Magic v5 to v6, HDDriver v4.x to
v7.61) and the quotes come to 80 UKP PLUS 4.99 postage and packing.
Sorry but these prices are taking the p*ss. The market is mainly a
hobbiest one and is dying, and prices like these are doing nothing to
sustain that market!

The PC market is not perfect, far from it, but on the whole you get
much better service from those companies after your money because of

the competition.

>atari applications, and that is great, but is nothing compared to all the
>moves the users have been taking...
My main interest in running Atari apps on the PC are those born of familiarity. I really want to run the likes of CAB, Lattice, Everest under that good old GEM interface. Now to this end I would hope that the PC solution would not supplant the TT but rather increase, for instance I would gain the ability to program my Atari when I couldn't normally by using Lattice on my laptop!

>WHat makes atari fun?
For me the fact that I have more familiarity with it (overall) than I do the PC. Also the fact that I am not (completely) following the other sheep. Vive le difference (with apologies to the French for my mangeling of their language :-)

>What makes atari attractive?
Familiarity, I feel more ocmfortable with the Atari by virtue that I have been using an Atari ST since 1986, but have only been using PC's since about '91 (I used PC's before that but only in passing).

>hate it, Just that there is NO need. Home-computing is a hobby,
>some people collect beer bottles, some other stamps, me, you guessed it is
>computing and music.
Agreed, I still own (and use) a number of Dragon 32/64 8-bit computers, my first love ;-) The people I work with snigger and laugh at my obsessions (Atari and Dragon) as we work and develop systems for some very high end PC systems (multiway Xeon based systems with Gigabytes of RAM, Terrabytes of disk, etc). Its just a case of what you ultimately feel comfortable with.

Though I must admit I do tend to program on the PC's more these days, purely for the fact that if I get truly stuck I can ask those people who surround me in work for help.

>Please, do not ruin my hobby by taking away the few users there are left
>already, I won't have the pleasure to share my passion with
>anyone else anymore...
Don't worry there are still plenty of weirdo's about ;-)

(the rest reluctantly snipped)

Bravo! Bravissimo!

I have always considered the emulators, from Gemulator to MagiC (I know, I know, it /isn't/ an emulator - it just quacks like one) to be a good way to make the transition from Atari/Commodore/TI/whatever to (ugh!) more mainstream (dull, conformist) computing. I am glad to say that I have no intention of starting that transition in the near future.

That said, let's face it - all of us will (probably) have to make that transition sooner or later. If you don't push it, if you don't buy the hype, but pick _your own time_ to do it, for your own reasons, you won't be disappointed, I think. IMHO.

K > Please, do not ruin my hobby by taking away the few users

I'm here, folks. And so is the rest of Atari Boise Users Group. And that is why we meet - to share the passion of a hobby.

Now that Titan Designs sells the Milan with english MilanOS (AKA N.AES
1.2), I would guess that you can buy N.AES as well.

>spent my time productively.

Hello all,

Paul hints at the reason that a lot of people including myself stick with original Atari hardware - the degree of control the user has.

If you run original hardware (and possibly the clones - I have no experience of any of them) you can boot-up in less than 20 seconds. You can then configure your system to your needs and increase your boot-up time accordingly.

Compare this with booting a PC or a Mac, even with a minimal configuration, and then running your emulator or MagicMac/PC on top of that.

In addition, running on non TOS hardware adds another layer of things to go wrong with your setup.

OK - you don't have all the powerful software that some of the other platforms have, but it is possible to build a system that works reliably to do the work you want to do, which means productivity. And is productivity not the second reason people have a computer (after tinkering with the system and installing/testing software they have no use for)?

It's not just the software that makes people stick with TOS, it's the kit that runs it.

Hi,

I just had a great idea. It goes like this.

I bought an ST - Atari stopped making and supporting them. I bought my wife a Mac - Apple lost their way. I bought a Jaguar - Atari went out of business.

So why don't I buy a Wintel machine - within 2 years I guarantee their position as the dominant platform will have been eroded to be replaced by a games console running a web browser.

>in the MGI version and what was the cost to register with invers?

I was talking about MGI's first English Calamus SL 98 release (Mars 98).
This version was really a mess. The august release is much better. Still a
few bugs left though. The most of then are only visible for MiNT/N.AES
users. These days the MGI and Invers versions should be the same as the
developement of the Atari version is made by Invers.
Registration through MGI seems to be cheaper then through Invers but the
reason for this is that Invers deliver some modules, like Bridge, Eddie
light and Franklin light that MGI doesn't (at least not back in Mars).
Because I've had some real trouble to get my copy through MGI, it took 12
months before I got my Calamus update -at that time I ordered an update of
SL95 to SL96- I decided to deal with Invers but again because the
different of package and although I was a registrated user of Bridge,
Eddie and Franlin, I had to pay another 149,-DM (around 138 Canadian
Dollars).

Nice said Katherine. I couldn't it say better.
Let me tell you the story of my brother. Once he had an TT030 which he basically used for DTP (with Calamus) and database. A year ago he bought himself a Mac performa 6300 with MagicMac because he had the intention the use Calamus on the Mac. Did he used it? No, since he has his Mac he invest in Mac software like Claris works. Why? Well, to print with Calamus on the Mac you need another piece of hardware (Powerprint). This piece isn't cheap and above all the printing is very slow. Furthermore with Claris works he can do almost everything he want to do, so why the hell should he invest further in Calamus.
Nowadays MagicMac sits there on his Mac beeing useless.

>Which one of those people is more an atari user?
>- a guy running NETBSD on his TT030?
>- a guy running magic-mac on his G3?

The first one ofcourse. This is also the opinion of Belgium Atari club where I'm member of. We don't allow any guy with a pc/Mac running some kind of Atari-emulation.

Considering Atari never produced an ISA/PCI 040/060 TOS compatible consumer machine, I find it hard for any of the clones to be considered truly "Atari compatible" as said machines never existed.

There is more to compatibility, especially concerning modern hardware, than just being "TOS" compatible. TOS is not aware of the CPU cache requirements for 040 and 060 processors. TOS doesn't know what an ISA or PCI bus is. That compatibility must come from alternate drivers/ operating systems. Savvy programmers include support for alternate video displays and other devices that are not found on Atari produced hardware.

Good example: HDDriver's support for 4 IDE drives.
Bad example : NVDI's lack of support of MACH 64 drivers.
Bad example : MagiC V4 non-support for the Falcon

HDDriver is a defacto application for all machines.

MACH NOVA users might as well stick with older versions of NVDI unless an agreement can be made to distribute the NOVA drivers with the NVDI package.

If you have an M/ST/E/TT go with MagiC for compatibility.

If you use a modern machine, one Atari never dreamed of, (ok, well maybe they dreamed of it) go with MiNT and N.AES. (I think that modified TOS machines fit this category).

Was the Falcon not Atari compatible because MagiC 4 didn't support the new Atari hardware?

Something that all these benchmarks fail to mention is that
most are done from ST RAM. Unless something has changed from
the last time I tried MagiC, it won't last long in alternate
ram on machines fitted with FX cards, Mighty Sonics, Afterburners,
CenTurbo II's, ect..... (not sure about the status of MagiC
on a PAK 030 and fast ram).

I prefer to load the O/S into fast ram, and MagiC (at least the
version I have) doesn't allow for it (right up to the point where
it overwrites itself:).

Falcon 040/42Mhz 4-64mb/NOVA Mach 64-4mb
Falcon 030/42Mhz 4-32mb/NOVA Mach 64-2mb
Falcon 030/24-48Mhz 14mb
Sparrow 030 (configuration in process:)
MSTE 68K/36Mhz 4mb
Falcon 060 (configuration in process:O).

(MiNT and N.AES is loaded on all the above).

Bla,Bla,Bla Mac Quadra 800 40Mhz MagiC Mac, PII 450 :(.

Nuf said.

It IS that simple. For some reason the PSUs which come with Atari kit only seem to be barely up to the job and will often fail. Direct replacements are expensive.

The PC PSUs of about 200w seem to last forever and it's a good idea to use an old PC case to house all the SCSI stuff (I have one here containing HD, CDR and streamer tape).

The devices need both 12v and 5v but you should find that the PC PSU is already fitted with a few of these connectors. And ... yes, just take 5v and ground from almost anywhere for the host adapter power.

You may need to do a bit of engineering to fit the DMA socket, no bother. Try to fit a DMA-OUT as well in case you need it in the future. Also .. try to fit a 50-pin Centronics socket for SCSI-OUT this is often useful for temporary connection of more devices to the bus. You best bet is to have the SCSI-OUT at the end of the SCSI chain and use an external active terminator to terminated the whole thing. All internal devices can then be unterminated.

Go for it.

I purchased my copy from Woller (www.woller.com)(last I checked).
He was talking about getting credit card ordering up a while ago.
I paid by bank transfer and got my order in about six weeks.
The upgrades to the latest version were also sent to my email
recently. They will respond to email in English.

I really should pay more attention to what I'm doing...

3. (2) doesn't make it so straight-forward to upgrade old resource-files
anyway.

Hi, you just state WHY I don't wanna use this feature: the need for an
8x16 font. That's exactly what I don't like.
Now thru' Gem.cnf I set the Rufus font (size 10, which may be 8x16 too,
but I gather it's smaller), so from MagiC my menu's look more to my liking
and the boxes become smaller too. Including bars on the windows. In
Gem.sys the font looks neat as well, but the window bars are old size.
Looks kinda sluggish to me, but I can live with it.

Jo, I deliberately used "mintnp.prg", because on earlier versions the use
of "mint.prg" lead to problems already. Never sorted out why it needed the
flags set like that, but I discovered it worked a lot better. MagiC didn't
like it at all, got all "memory block destroyed" messages again.

Maybe the kernel is better now?

Well, since I just started new with this stuff, I don't have VFAT
partitions set up for it. So I used the line capitalized. Perhaps I should
go for small chars. Anyway, it's not all that important, Thing's being
started from Xboot anyway.

Message-ID: <75o4uoncq1@roch.zetnet.co.uk>
Source record: 87800

All,

Just in case you are not aware there is some hacker on the net how is sending people a file called ".exe", its 112K big in size. It hide out in you C:\windows\system\ folder. It does not show up as a icon, but if you auto arrange the icons it will appear to be a strange black space in the window. Click on it and delete it.

When ever you are online you are at risk, its happen to me and I only just found out that this hacker had taken over 7 meg off my harddrive before I noticed it. I have no idea how I got this file, but beware !!! It also reboots you computer for no reason as well just so windoze loads it into the system so the hacker can get files off your drive.

There has also appeared 100's of P00000**.hbp file all 39K which say PCL RIP in there which I can only assume is someting to do with the hackers program.

THIS IS NOT A JOKE !!!

4924. Alternate Desktops/OS's for ST/TT systems

Newsgroup: comp.sys.atari.st
Date: 1998-12-22 00:00:00 UTC
From: mstulir@geocities.com
Message-ID: <75occlcdp1@nnrp1.dejanews.com>
Source record: 87804

I am trying to find a good listing of the alternate desktop programs, and OS replacements that are available for the ST/TT computers. (Magic, Thing, MiNT, etc.) I am also looking for the corporate/author/publisher webpages that support these products. I've already tried the search engines, which turned up sites that don't exist anymore, or had information that was EXTREMELY out of date. I checked the ST/TT FAQ's, and found them to be a little thin on coverage of this subject. The TT030 homepage has a MiNT section, but it (along with most of that site) has been disabled for months.

The Neodesk/Geneva homepage is still up, and I hold licenses for both programs, so I shouldn't need info for those products.

This is in preperation for a new page on my web site that will cover and review these desktop replacement programs/OS upgrades.

Where in the US can I go to purchase and/or register Magic, MiNT, Thing, etc.? (For example, ASH's homepage still lists Toad as the US distributor for Magic. I find that a little hard to believe, considering Toads recent poor attitude towards us Atarians.)

Thanks in advance for your replies.

Come on, you've been around here long enough to have seen that question
answered a million times. It's in the Quick FAQ. Just format a 720K DD
disk on the PC and you're set.

Why you would want to run a BBS from a single floppy system is beyond me
however...

This is weird. 'shell' command is suitable for launching the desktop
and it always worked here. Are you both sure, that you're talking about
AES 4.10, not 4.0?

Anyways, shouldn't it be 'shell c:\thing\thing.app' instead of
'shell=c:\thing\thing.app'?

Cu,
Draco

4932. gem.cnf

```
Louis
SHELL in mint.cnf and in gem.cnf is not the same.

put this in your gem.cnf (which itself should be in your c:\multitos
folder).

setenv THINGDIR=G:\THING
setenv AVSERVER=THING
shell G:\THING\THING.APP

as for the font, it doesn't have to be FNT, or monospaced, or 8*16, just
that this is the best choice if you want all the programs to display
correctly.

The AES only should start the desktop. No MiNT.CNF or the auto.

-------------------------------------------
/
MiNT Is Now TOS, let's move on, shall we? /

Which are, Peter?

Just don't say me again that MiNT privilege violation
handler is buggy just because it doesn't allow STiNG to do dirty things
you coded there (that ori #$00,sr nicely contrasts with your postulate
of clean programming you mentioned earlier in your mail).

> > Reentrancy will soon be a reality in MiNT as well, but it will require

> taking over certain MiNT standards.

I am sorry to disappoint your satisfaction, Peter, but this is not true.
The MiNT XDD/XFS interface will be kept. It doesn't make reentrancy
impossible. This was TOSFS what it mainly did, and some routines at
very low MiNT level will have to be slightly changed.

> > This is not correct, since MagiC still doesn't implement everything in
> > MiNT or MultiTOS.
>
> Which is ? Try to point. You'll find it hard to find anything application
> (meaning not system software) related. And don't come up with things like
> "small background process priority".

Which is Pfork(), Pvfork(), Pgeteuid(), Pseteuid() (just to mention two
of
numerous MultiTOS user/group related calls), Psigintr(),
Tget/settimeofday()...

And for MultiTOS, MagiC up to version 6.0 didn't implement menu_popup(),
which
is a normal call for AES 3.40 in Falcon TOS, A.D. 1992!

> I believe for any significant file size this would be the case, even for RAM

I'm sorry I don't have SB3 anymore, I upgraded to Videlity about 18
months ago, and upgraded from Videlity to a graphics-card last year
:-)

paul.williamson@zetnet.co.uk (Paul Williamson) wrote thusly:

P > As to the future for Atari programmers, I have one request.
P > Please - keep it simple :-)) Why ? Well the only real
P > disappointment for me when I got the Hades was the need to
P > start fiddling with "Inf" files, it suddenly seemed like a PC
P > :-(((

(pedant mode on)

Actually, /not/ fiddling with inf files, but letting install
programs do it for you, is more like a PC.

As in everything, this is a trade-off. The question is: do you want
an install program to write to your hard drive, doing
who-knows-what, or do you want to write to your hard drive more
directly, via editing inf files and saving them. Some of us prefer
the latter; you obviously prefer the former.

(pedant mode off)

As for my request in future Atari programming - just don't let the
silly thing bloat up the root of C:\ by writing and rewriting
endless inf files, like a PC. My son has been observing the increase
of disk space used on a PC, and it really does just that under
Windoze.

> but I gather it's smaller), so from MagiC my menu's look more to my liking

I have used proportional and odd-sized fonts with N.AES, and while
N.AES itself looks good, there's a lot (and I mean *a lot*) of apps
that doesn't handle this very well. Older apps generally works fine,
but newer apps with lots of userdefs often looks really bad. I have
switched back to a 8x16 font long time ago just to keep those apps
happy.

4940. Calamus 95 is now dead

Newsgroup: comp.sys.atari.st
Date: 1998-12-22 00:00:00 UTC
From: Paal Monstad <pmonstad@online.no>
Message-ID: <75ojrina1@readme.online.no>
Source record: 87820

The Canadian company MGI has stopped support and developent of Calamus 95 for Windows. Version 2 will never be released.

PC users are told to get MagicPC, NVDI and Calamus SL 98. Calamus 98 (the Atari version) is still supported by Invers Media Verlag in Germany, and they promise to develop the program further.

Try Katherine Ellis' page (http://kellis.atari.org/ IIRC) for the
Atari AES 4.10 beta. XaAES will probably be "in progress" (maybe...)
for a long time... (everytime this subject comes up I feel like
working on XaAES. Then I download the latest source, have a look at
it, take a look at my schedule and then hide away the sources...)

AFAIK you can have upto 10Mb ST-RAM, and 256Mb TT-RAM. Try
http://www.aixit.com/ for TT-RAM upgrades.

I'd really recommend TT-RAM instead of more ST-RAM, it's a lot faster
and probably easier to get hold of.

4944. CD-Recorder 2 doesn't work for me

Newsgroup: comp.sys.atari.st
Date: 1998-12-22 00:00:00 UTC
From: Uwe Roeger <uwer@delos.stuttgart.netsurf.de>
Message-ID: <Pine.NEB.3.95.981222180131.10048A-100000@delos.stuttgart.netsurf.de>
Source record: 87824

After a friend recently bought the CD-Recorder 2 Package for his 1040STE he ran into problems which we couldn't resolve so far. The System consists of the aforementioned STE w/ 4MB RAM, a Link97 Hostadapter hooked up to a 500MB HD, a 2.1 GB HD and a Philips CDD2600. HDs are driven by HDDriver 7.60 :) .
The package will write Audio CDs without an error message in single speed. The written CDs won't play right, though. On normal Audio CD-Players you get about a second of music, two seconds of silence, a second of music an so on.
Data CDs can also be written without error messages. The final product though, only contains directories and empty files.
After talking to Soundpool and WB-Systemtechnik without getting any further, I'd like to know if anyone else has experiences with such a setup or myabe can come up with ideas.
The Soundpool ad claims that the programs work on ST/TT/Falcon and Hades. Herr Baumgaertner at Soundpool told me on the phone that the program should work on a Mega ST (yes, ST!) but won't work on a 520 ST, 1040ST or 1040STE. To be honest, I don't understand why, because AFAIK the DMA-hardware is the same on all of those models. (Apart from a little buffering in the STEs)
Any ideas? Anyone? :)

Best Regards, Uwe Roeger

Thanks Katherine, this one worked, even in non-cap letters.

Now I'm experiencing something funny here: I already mentioned that once on the desktop, Menuinfo displays something like 4 Megs of TT-RAM, whereas during the boot Mint says it found 64 megs. Just loaded a bigger JPG into Graftool and guess what: it says "need 4.7 megs for it and don't have it". It means that eather Mint.prg or Gem.sys eats around 60 megs from my fastram! Where does that go, or better: how can I stop it from eating it? Not Thing, this one only limits thru' MagiC :-(

Oh yeah, about the font: long time ago I started disliking this big, fat and ugly Atari systemfont. So on my ST then I started using VDIfont.prg, to change the AES font into something neat (my opinion!), like a 7x12 one or 9x14 one. Bloody nice menu's, some boxes about the same (Menuinfo's box), some boxes mixed up with old system ones and the new font (Thing's boxes).
Then I started with MagiC, let MagiC change the AES font and it did a nice job, all the boxes became nice 'n smaller, window bars ditto. Real good look. Oldies that couldn't use other fonts thru' GDOS (like Storm) displayed neat menu's but the window contents were with fat ugly systemfonts again. Running 832x624 I mainly use the Rufus 10 point size font, I believe it's 9x14, but anyhow, I just like the font by its looks.

So now with Gem.sys, I use it again, haven't seen any problems with boxes or what, just the window bars are old size again. Well, to me it just looks "sluggish", don't know how to explain, "1985-fashioned" is perhaps the best description. Everything in nice colors, 3-D look (AES 4.10 ain't

that bad), but *fat* bars...

No reason to go back to MagiC, perhaps it'll become better with N.AES...

Next thing will be setting up the Internet kit for Mint. I'll be back with more Q's... :-)

Meanwhile, happy holidays!

> Andreas Kromke for not using ;-)

Again, I would like to point this out, because I don't like unfounded rumours. I don't know where you have taken this new from, Jo, but this isn't true at all.

The XDD/XFS interface in MiNT won't be changed to follow MagiC. And MiNT reentrancy has hardly anything to do with XFS/XDD interface. Then, the VFS scheme in MiNT _may_ be extended in the future, but this definitely has nothing to do with MagiC VFS, just because (surprise, surprise) that last is too poor.

Of course, the true part of the cited phrase is that MiNT will get reentrant
once we got rid of the TOSFS.

Cu,
Draco

Who cares if what they did was silly?

The point is, we are running TOS machines. If Magic deviates
from expected behavior, then _IT_ is the problem.

Ronald, if you quote, please quote correct: I wrote that, not Johan!
And I didn't say it is rotten, I said it looks rotten (small difference).

My opinion? Wait till you find another *decent* font and give me yours
again!

I agree a non-prop font is the best, and on larger screens (that means
from 1024x768 upwards) the systemfont isn't that bad, but I stick to the
opinion that up till 1024x768 there are better ones. Period.

Ever seen AES 7x12 on a ST-High screen????? Then come again, please!

Give it a try at least and then compare... I consider Monaco, Ocanom and
whatever more "replacement fonts" about just as bad or even worse than the
Atari one. But there are others: the bloody old Rufus Ansifont, the one
mentioned a few lines above, Jinnee 12 isn't that bad.

Only requirement is that the font should at least have some characters
similar to the AES requirements. Some don't and are thus unusable.

Thomas, I am using 1.26 (not 1.27, because of the "SHAREWARE" banners all
over my desktop... I know, I should have regstd long time ago as promised.
Tried to reach the dutch C.S.R.P., but zip/nada reactions. So it's gonna
be first thing after Xmas... (or the New Year).

Anyway, the infobox under Gem.sys wouldn't allow me to reach/edit the
field at all.
It also said "Magic! memorylimit" so that explained it to me.

So maybe Thing >1.26 ???

Happy holidays!

> is slower than on my TT.

You've only tested the demo, that's what is wrong. As was mentioned a while ago, MPC is pretty useless without NVDI-PC, due to screen redraw speed etc (though you can tweak the settings anyway). Without NVDI-PC I had the same stuff with jerky mouse pointer etc. NVDI-PC does more than would immediately meet the eye, in that it converts a lot of stuff into native Windows screen instructions, so graphics-wise everything speeds up and gets smoother. Plus you get extended screen modes unavailable in raw MPC.

Can't comment on compilers etc but ST-Zip unpacked several large archives in a couple of seconds that would have taken more like minutes on my STE, so computationally it's not that slow. However, MPC doesn't have anything like the speed of MagiCMac due to the CPU emulation.

> which uses a dongle in the ROM port, on a PC with MagiC ? If it cannot
> be done, then many of us will never have the option of using MagiC PC.

It's highly unlikely it will be done:

1) Cubase uses its own multitasking kernel (M.ROS) and doesn't get on well
with Atari mutitasking OSs, particularly MagiC. Apparently you can get it
to work under Geneva and N.AES but not without some problems.

2) There isn't anywhere to plug in the dongle on a software emulator so you
would need to use a cracked version of Cubase.

3) Even if you could get it going, heaven knows what the timing etc would
be like as it would be going through three lots of multitasking (M.ROS,
MagiC, Windows).

You'd be better off using a native PC sequencer on a PC, in a nutshell.
However, you'd probably be better keeping your Atari if you just want to
use Cubase for MIDI, as the timing is supposed to be better anyway.

<snip>

> For example, I really should get on and change from Newsie to Okami, but
> all the posts I have read on this subject make it quite clear that I will

> need lots of spare time to do it.

Okami isn't really that difficult if you read the manual and the comments
in the setup files. The first time you set it up it'll take a while, but
after that minor alterations are very fast. NEWSwatch and POPwatch are
very easily configured, certainly no more complex than Newsie.

> Why, I wonder, do I need to have 3
> programmes to make it work when Newsie (almost) does it in one ?

The "almost" says it all. I never got on particularly well with the
newsreader part, the ftp bit was very unreliable last time I tried it, the
browser superfluous if you had even the freeware version of CAB and the
thing has some horrid bugs which can kill hard drives. Use CAB for
browsing, aFTP for FTP, Okami for mail and news and you'll find everything
works a lot better, believe me.

> Why
> will I have to use a text editor to change various inf files, is it not
> possible to organise this through preference menus etc. ?

There are pros and cons to both approaches. Anyone who's played "hunt the right dialog" on a PC will know the problem. Oasis was a prime example of similar things with Atari software. Sometimes an ASCII config file and a text editor seems a more logical and friendly alternative!

> I know that many of you on this group really understand your computers

Carry on with this line and you'll end up wanting "wizards", which I can guarantee will *not* make your life easier! I think the bottom line is that the more features you have, the more there is to set up. You can either have a million dialog boxes or put the whole lot in a text file along with copious comments, which can actually be easier to understand sometimes.

Budgieware was an example I used - just one example - the PD scene is
so full of various copyright info that each program would need
checking to see if it could be made available by any particular
distribution medium - yes including the internet. When I worked at
HENSA checked the docs of each and every file that I uploaded to see
if there were any distribution restrictions. If there were, I
contacted the author and got their permission to upload.

HENSA was a full time job.

The CD Collection will take a long time to go through each program
(OK, apart from the ones we already know can be distributed by ftp
sites - CAB etc)

Regards
Danny

4974. ** Announcement... Login.prg

Newsgroup: comp.sys.atari.st
Date: 1998-12-22 00:00:00 UTC
From: quantum@voicenet.com
Message-ID: <mIGf2.482$7P2.6498157@news2.voicenet.com>
Source record: 87876

Greetings peoples! I am here to tout and generally advertise my new program, Login. It is designed to allow different people using the same Atari computer to have completely different desktop configurations, Auto files, Cpx files, and desk accessories all controlled via a username and password akin to Unix. Version 0.1 beta is done, ready to go, and is working fine on my Atari Falcon030. It is only a baby step in what I hope will eventually be a multi-user upgrade for any single user Atari OS (Tos, Magic, Geneva, etc.). How far this program goes and what gets done with it is totally up to the people who download it and what responses I get from it. Login allows up to 25 different user names and a SMALL degree of security (eventually I hope to make it hackproof). Note, it's also good to set up for programs that like a desktop config different than what you normally like. Now you don't have to boot up and make changes, just login as a different "user" and it will be set up and ready to go. Login is incredibly easy to use, especially for those who have used Unix at least once.

To download it, enter "http://www.voicenet.com/~quantum/login.zip" into your web browser, or drop me an email (quantum@voicenet.com) if you would really, really like it and can't get it via the web.

Hope this program is useful to someone besides me! Keep a smile,
George Garner

Source record: 87877

Sorry, I forgot to mention that Login is completely and
utterly free for all. The read_me.txt file says it all; basically, I
only want an email or a postcard in exchange for it just so I know
that somebody else is using it besides me.
Oh, and also, for now it can only be used by those who have a
'NEWDESK.INF' file and not a 'DESKTOP.INF', and it must be on the C
drive. Again, when demand pushes me I will make the necessary
changes, but I just wanted to get something out there to see how many
people would be interested in this program. I wrote it primarily for
myself with the hope of sharing it with my Atari bretheren. It is not
now, nor do I have any intentions of making it commercial. (Free
software! Woo hoo!)

I see your point, but I'd still like to argue here ;-) MagiC will not run
standalone on all hardware either, in fact it will run on *less* hardware
than MiNT. This is mostly because MagiC will have to initialize a lot of
hardware when it boots, which MiNTnaturally don't have to since TOS has
already done so. But let's look at what's left of TOS when MiNT has booted on
a typical system:

* Printer-access.
* DSP on Falcon.
* Keyboard.

I wouldn't worry about the old (x)bios handling these devices, atleast not
when considering the advantages.

> I believe there is no standard way to define "completeness" of an OS, so of

I have never suggested this either, in fact I find the term "complete OS"
rather pointless...

* MagiC does not support toolbars.

* MagiC does not support 3D-objects as defined by Atari.

* MagiC does not have Pfork() (Note that this is something that has been told
me recently on csas, I have not checked this myself).

* MagiC does not support Pexec(...100..).

There's also some other abnormalities in the GEMDOS I've came across, but since I don't have any docs here at work I can't list them here.

> BTW.: In many respects MultiTOS doesn't even itself live up to Atari's
> specs ("bugs"). In those respects I'm quite happy with MagiC being

Implementation and specification are two entirely different matters :-)
Nobody in their right mind would claim that MultiTOS is better than MagiC...

...but if you want to use the extended features of either systems and still stay compatible you'll have to reimplement it on one of the systems. This is not a major problem yet, but there's a lot of potential in both systems that's not currently utilized because of this (e.g. toolbars in AES 4.1, AES-threads in MagiC). Some communication between the developers would have improved things greatly.

I fully understand that, and I've never questioned Andreas' ability as a programmer and developer. But by defining it's own standard without...

a) ...approacing the MiNT-community and perhaps agree on a common interface.

b) ...release documentation that's readable by the people that has developed most of the things that *use* these interfaces in MiNT.

...has not exactly helped MagiC. How many programs use these interfaces today? Spin and one or two ramdisks? It might be technically superior but if they're not used they're also worthless.

I don't have a clue if the MagiC-interface is suitable for MiNT, but if it is, it would be ridiculous not to use it.

All features I mentioned above has been present in MiNT/MultiTOS since it was
under Atari's licence. Things that has been added later can ofcourse not be
regarded as a official, universal standard.

> > the same things under both systems? I can run some memtest and

Yes, GEMbench will give about 10% better "performance" under MiNT than MagiC
on my Falcon. But since GEMbench-tests doesn't make sense at all this doesn't
mean s**t.

> There is a lot of truth in it. Do several variing benchmarks, one is not
> enough. Note that designing good benchmarks is a science that is hardly
> understood by normal programmers. GEMbench is kind of a standard, but I've
> seen it give really ridiculous results under unusual circumstances.

GEMbench-results are worthless, they're not even consistent under identical
circumstances. When I use it I always calculate the average of five identical
tests, which results in more consistent figures but consistent figures don't
mean much when they're wrong...

The most realistic benchmark IMO is to time actual application doing their
stuff, and my tests showed that on average, there's no practical difference
in speed between MagiC and MiNT/N.AES.

> > life. But it *does* beat it when it comes to flexibility and
>
> Flexibility ? Due to the variety of software that has been derived from the
> GNU project. Without that software, I disagree.

Ofcourse, without software no OS usable. MiNT is more flexible for me because
of MiNTOS, it's english system-docs, it's free source, the networking
possibilities (NFS, lpd or Samba under MagiC anyone?), the virtual consoles,
the shells...

> > stability,
>
> ??? Used MiNT for a while, and it's stability was one of the reasons I moved
> to MagiC. MagiC is rocksolid, virtually never crashes without some software

> claims Atari did something strange in them. Can't tell if there is any truth

It's true, MagiC really sucks on some Falcons, including mine. It will even crash if I boot a clean, fresh MagiC-innstallation and leave it alone.... However, I have never had such problems on the Mega ST or TT.

What I *do* have problems with is MagiC's error-handling, it's a lot more sensitive than MiNT/N.AES to runtime-errors. My experience is that problems that's easily catched by MiNT more often results in a total crash in MagiC (and no, I don't use memory-protection in MiNT).

> in that. MiNT crashed far more often for me, maybe due to it using so much
> unstable TOS code. If that's true, then probably it behaved better now with
> the new FAT fs.

MiNT has always been stable here, I've used it since 1.12.6. Maybe you've been using MultiTOS? The original MultiTOS is a horrible piece of software, it does a lot of busy waiting (hence slowing the machine with 35%) and crash constantly.

> the latter. From what you wrote above, you appear to not have seen any version
> after V3.0 or V4.0.

I have 5.1x installed on all my Atari's, although it ceased working on my Falcon some time ago. For some reason it won't work with my graphics-card, as soon as the AES initializes it switches back to the Videl. It does work fine on my Mega and TT though, I mostly use it on the TT to experiment with I-Connect and STiNG.

> I do share cycles almost evenly between foreground and background, the top
> application is quick and responsive even on a 8 MHz ST. In fact, makes me
> wonder if you had something else going on in that machine.

Nothing special, just the ordinary stuff: Thing, SMU, a clock.

Btw. there is "something else" that has greatly influenced the performance of N.AES, and that's MultiStrip. I used it the first month or so when I got N.AES, and while I was very satisfied with the speed it didn't feel as "snappy" as MagiC. One day I sat down to find out exactly what the CPU was used for, guess my surprise when I discovered that MultiStrip used 20% CPU-time (18MHz Falcon), constantly... Not only that, it put a heavy load on the AES itself, which used twice as much CPU-time with MultiStrip running.

This was with MultiStrip 1.2, since then 1.3 and 1.4 has been released. I've tested them both on my Falcon/Afterburner and while they appear to be faster than 1.2 it still use 3-5% CPU-time and raise the load on AESSYS by the same amount. That's quite acceptable on fast machines, but I wouldn't recommend it on standard Falcons or ST's.

My first guess would be that he did this to create a nicer looking AES, which he undeniably did. He went even further in MagiC 6 and created an almost beatiful AES, although I'm still not sure if I like the thick window-borders.

Another reason for drawing the 3D-shadows inside the objects instead of around them is to make it easier to modernize older resource-files to 3D. A good point, but my opinion is still that this was a mistake:

1. Resources designed under MagiC looks bad under any other current AES with 3D-objects (obejct-borders often overlap).

2. The interiour of these objects are smaller than under other AES'es, which can cause problems with applications that follows Atari's standard.

3. (2) often renders (1) mostly useless.

Unless you can get access to a secure browser - that means either a PC with the CD ROM obtained from Dixons or wherever, or CAB running under a MiNT environment with the appropriate CAB overlay - you won't be able to set up an account.

Once you've actually set up an account tho' you can plug the details into STinG quite easily - I'm using a freeserve account right now.

Hi Jo,

Are you saying that the ScreenBlaster version 3 software caused you
lots of problems than version 2?

I have version 2 and have no problems at all with Geneva/NeoDesk.
I am in a resolution of 1280 x 960 with a scrollable screen of
1280x1280 in 16 colors. I can go much higher with a scrollable screen.

I can get a resolution up to 944x720 in 256 colors. I have tried to
get 1280x960 in 256 colors without any luck. Not sure why.

The problem I have with the software is my 17inch SVGA monitor will
do a maximum refresh rate of 100mhz. The ScreenBlaster version 2
software will not allow me to enter 100.00 in the monitor data. It
only allows 4 digits xx.xx. Also it seems hard to configure any
other resolutions other than the default ones.

Other than that and not being able to do 1280 x 960 in 256 colors
for some reason, which I really could use. I find it very useful.
The display is rock solid and fast on this stock 14meg Falcon.

I tried to download the Videlity demo from Titans page without luck.
I have not had much luck with purchasing Titans stuff for some reason.
Maybe just bad luck. I was able to get a Expose from a nice fellow
in the UK. Works great. Nice piece of hardware.
Will Videlity allow me to do 1280x960 or better in 256 colors?
Or is there a limit with the Falcon that prevents this?

Also would you happen to know what upgrades that were made in version
3 of the Screen Blaster software if ya know? A readme file from
version 3 would help if you have it and could pass it along.

Thanks for you help,
phantomm@kih.net

Hi Mike,

Great, I am always amazed at the software available for the Atari platform
that seems hidden. And the tails of how it all comes about is a important
part of Atari history that is overlooked. I'd sure enjoy any thing
you could put of your page about Fnordadel.

Would you happen to know if Fnordadel will work on a Falcon?

I'll keep my eye on your page for Fnordadel. ;)
Maybe you can post a message here when you get the info/software
up on your page.

Thank you very much,
phantomm@kih.net

4983. Sam on 14meg Falcon

Newsgroup: comp.sys.atari.st
Date: 1998-12-22 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <75nkhe$h4o$3@dbtsvr2.dbtech.net>
Source record: 87885

Hi folks,

I have had a problem with Sam version 1.2 ever since I upgraded my Falcon to 14 megs. It works fine except for playing back of any large samples, especially if they are over 4 megs. I get strange sounds during play back. This never happened with the 4meg board.

Any large sample that I record and save with Sam and play back with different software is fine, no problems.

Some Falcon owners do not seem to have this problem. And I am trying to track down exactly what is causing this. Is it a bug in the software? A hardware problem with some Falcons? Or confict with other software?

I have lots of other recording software that records and plays back just fine. My sound system is rock solid other than this problem with the play back with Sam.

I have tried a upgraded version of Sam version 1.2 and version 1.3 that was updated awhile back. I still have this problem with these versions as well.

Does anyone else have this problem or knows what is causing it?

Thanks for any help,
phantomm@kih.net

MagiCPC is a pure software-solution, so unless you get your hands on hacked versions you won't be able to use dongle-protected software. I don't think MagiC is the best environment to run Cubase in anyway... (as someone else pointed out, Cubase has it own multitasking software, running it on top of a multitasking OS is probably too much.)

> As to the future for Atari programmers, I have one request. Please -

What OS do you use on your Hades? AFAIK there is atleast one GEM-based setup/configuration-program for MagiC, and sometime in January or February there will be one for N.AES as well (I'm working on one, I've spent two hours on it and it actually sort of work already. CF-Lib is handy :-).

> suddenly seemed like a PC :-(((I really enjoyed the simplicity of my
> Mega ST, and more importantly, every time I went to use it, it worked and I
> spent my time productively.

So did PCs before they got extended memory and Windows... I remember using 4.77MHz Olivetti PCs with DOS 3.something, CGA-graphics, 512Kb RAM and a 20Mb harddisk at school. They always worked, so did Word Perfect, Dataease, dBase, Turbo Pascal and everything else I used. Modern PCs are atleast 100 times faster, but I need more time now than then to do the same work. Progress anyone? ;-)

That would explain a lot, this one never worked properly on my Falcon either.
I had lots of problems, most of them similar to yours (wrong resolution,
missing (all-white) gadgets etc.).

> BTW, running Mint + Gem.sys (which is AES 4.10) surprised me by the speed
> it produced. I had expected much slower performance... The only thing I

The latest GEM.SYS is pretty fast, although it can't compete with N.AES at
all. On faster machines (Afterburners, Milan, Hades, TT) it's still highly
usable, a very nice freebie.

> don't like is I'm back on the bloody Atari systemfont in the menu's, boxes
> etc. VDIfont.prg won't work because it modifies the AES, and so does

Why not just select another system-font in NVDI? This can be done very easily
with the assign.sys editor in the NVDI-distribution. You'll still need a
monospaced 8x16 font though, like the Monaco-font included in NVDI.

Perhaps you've disabled memory-protection? Unfortunely even current
applications have problems with memory-protection due to nasty
programming-techniques (poor implementations of the VA-protocol, callbacks
between apps), so you'll have to experiment with the program-flags to get
everything right with memory-protection.

GEM.CNF is documented in the Atari Compendium, and perhaps also in the
MultiTOS-manual (do you have a Falcon?). If you still haven't found the docs
by tonight I can mail you the relevant pages from the Atari Compendium when I
get back from work.

I can understand your worries, but there are severall reasons to use MPC. In my case I have a PC at home for my work. There are things you could do in TOS that are more work on a PC. For example: I had a lot of files that had to be renamed. With Windows (as far as my knowledge goes), you have to select them one by one and rename. With TOS you can select them all and rename. I did this with the demo. I did not do any real speed tests, but the little time I worked with it, it seemed okay. But as I understand it, you have to install NVDI. Also the demo is slower then the real program (I think). I have not decided yet (should do some tests), but I think that the change that I will buy it, is not small. But I also think that I will keep my TT. So in my case it would not be a leaving of the Atari hardware.

My system is less then yours, but I did not experience any of your
problems. I did install the NVDI i have on my TT. So maybe that is the
problem. I did not play much with it till now, but I find that it
looks promissing.

> a
> compiled or interpreted benchmark)
>
> Test 1 = 261
> Test 2 = 805

Most definitely interpreted, unless the timer in MagiCMac is seriously
screwed up. Btw. this powerbook is a 33MHz machine, not 66. It should be
about as fast (perhaps a bit slower, I run at 40MHz) as my Afterburner.

> Hades 040, NVDI

>
> F030 und NVDI
> CPU/18MHZ CPU/36MHZ
> Test 1 = 47 34
> Test 2 = 2122 1902

OK, do you see that this is nonsense? A 030 at 36MHz is not, absolutely not
faster than a 32/33MHz 040...

> Mega STe, PAK68/3 50 MHz FPU and FastRAM(?)
>
> Test 1 = 72

And this, a 50MHz 030 with FastRAM is only half as fast as the 18/36MHz
Falcon?

> PS: Beware of the fact, that the timer is slightly running slower under
> MagiC
> PC so you maybe have to add a little bit on those machines.

I'm sorry, but considering the results from well-known (to me) machines I
can't see that this test say anything remotely sensible. It looks more like a
random number generator.

It doesn't have an executable extension, then or isn't marked executable
(when on a MinixFS). But that's not important here.

> It also said "Magic! memorylimit" so that explained it to me.
> So maybe Thing >1.26 ???

No, but you can limit memory of /installed applications/ with both
N.AES/MultiTOS and MagiC in the "Options" section.

Of course, that doesn't help with gem.sys, as it's execution isn't under
Thing's control. For that, try to limit memory globally from within
mint.cnf (maybe that's already done, which would explain even better why
you're told about very little free memory, because a program doesn't see
more free memory than it's allowed to allocate).

Ciao

Thomas

This day I installed MagicMac 6 and powerprint too on my brothers G3.
Calamus prints but very very slow. It took about 3 minutes to print one A4
page (just text) in 600 dpi on a HP laserjet 5 (1 min for 300 dpi). Very
useless for the moment.
What probs do you have?

I see that both of these programs are available on the Intel version of Linux. What will it take to get these ported to the Falcon/Atari version of Linux? If Netscape is giving away its source code, then can we port it ourselves?

>processes) tells you how much memory they use.

Well, didn't check with another app (Kellis' Freegem won't run...!)
And I'm sure it's gone: Graftool on a larger JPG said it wanted 4.7 megs
and only had 4 megs.... that enough?
Menuinfo is supposed to be Mint compatible, so why would it lie to me? It
displays right with Magic, figures are 3696 kb ST and 50421 kb TT after I
boot to the desktop from MagiC.

Checked it again running CLEAN: only Mintnp and Gem.sys plus the accs:
same stuff.

Here's what u:\proc gives me:

AESSYS 001 1724096
FREEDOM2 012 275808
MENUINFO 013 49104
MINT 000 4320
NEWDESK 011 4194304
SCREEN 010 1968
ST-GUIDE 014 56944

Totalling up to 6306544, so where's the rest?????
PS: Oh yeah, I found no 60 megs in u:\dev, pipe or shm either...
>
>> Major Q: how do I prevent Gem.sys from taking 60 megs?
>
>My bet is that it doesn't, but check in u:\proc first.

Well, come over and help me find it :-)
>
>STiNG will work fine, but beware that booting-order is important You
>should first run NVDI, HS-Modem and what else you might want, then

>MiNT, and finally STiNG.

Gawd, I know that (sorry). It's exactly what it should be, Mintnp running one-before-last, Sting running last. That's what the boot says too and that's what "running order" tells me as well.
>
>Your memory-problem suggests that there' something wrong with your
>system, so try to figure out where those 60Mb are first.
>
I told you, maybe it's the cause of the speed, which from the first moment on surprised me :-) Or Gem.sys is trading in fastram for firecrackers, who knows? Gotta switch this bunch on Dec. 31, 23:55 and gotta watch the show :-)
Drats, have I spent 300 USD on RAM and Mint's shoving it down the drain for free????
Perhaps Mint is not "latest-model-Aixit-card-compatible" (you listening, Martin-Eric?), or is my RAM not Mint-compatible, or my TT, or is Saddam Hussein playing dirty tricks here? Who knows...

Yes, I know it: it's Bill Gates trying to get me to Win-2000 :-)

Hi Louis, Are you sure you don't have the line:

MAXMEM=4096 in your mint.cnf ?

It looks/sounds like this to me..
If yes, it will limit all the applications to 4meg, including the AES.
In which will only sub-execute process < 4000.
That's just a guess..

On 23 Dec 1998, Alfred Radauer wrote:

> Yeah, and that is the *REAL* problem, why Magic has taken the lead. In
taken the lead, well, I thought so, so a year ago or 2 I took a poll, and
reveiled that magic is not the number one OS, not the most popular.
Few months ago, Bengy Collins (magic support page) has taken the same kind
of poll (survey) has yes, MiNT 36% and magic 34% or something like that.
So it is not obvious, but EVEN if magic is more popular, it certainly
doesn't make any quality difference.

> 1993, when Eric Smith still worked on MinT there was no question for me
> that I would use MultiTOS, advancements were at that time incredible.
> Six years later the MinT project IMO failed.
You obviously have NO idea of what's going on on your own platform.
A project to fail, fail what? business wise? quality wise? user-base wise?
You can see that those can not be applied to MiNT.
businesswise, mint is free, hence no revenue..
quality wise, That's up to the users to deceide, not 1 magic user like you
who didn't touch MiNT since 6 years ago. Always need comparaison.
userbase-wise, well, recent surveys shows that magic is not in the lead,
even if it doesn't feel this way.

> more than a patched version of Erics MinT. Some XFSes were programmed

> the sources, changes some glitch and that's it, major problems, such as
> the TOSFS have not been solved after more than half a decade.

hmm Captain Caveman, when arguing, developing an idea/opinion, it is
always good to have backed up/checked what you are saying..
Coz there has been more development in the mint area than magic.
MiNTnet? hm like 1 or 2 months ago updated.. Sure feels like years ago ;)

> And noone even bothered to start programming a replacement for (N)VDI
> and/or SpeedoGDOS.
Once again, Fvdi in case you were curious.

>
> we leave out MagiC and its derivatives. Just to give an example, STinG is
> much more popular than Mint+MintNET.
hmmm popular? hm probably yes. STing is probably more popular as it
doesn't require MiNT to run.
But again, go with the most popular or the stack that works best?
Funny enough, but the MOST popular internet Stack (STing) still lacks many
things. Reading the problems in this newsgroup, you STing users can't even
receive decently email, or read news, or How many have problems with ftp?

Not even talking about the fancy extra tools, icq and so on.
But at least, the basic tasks should be done efficiently. Which STILL aren't. And magic or not magic, you still get to use STing, which is fine by itself (nice prog and achievement, considering it is meant to run in singletasking).

2nd point, "if it ain't broken, don't fix it" some tools havent' been updated since years. And for 1 reason, coz they work as expected.
Even in the linux comunity, take uuencode/uudecode, or man or programs like that, They don't get update very often, YEARS in between. Coz they just simply work. And don't need extra feature coz the role of each application is very well define. So no need to have uuencode to translate from GERMAN > ENGLISH then encrypt then zip.
uuencode, JUST uuencode. Very basic tool. But performs rather well.
As opposed to some Newsie that almost makes the coffe in the morning..
(no offense to Newsie, could be a nice program)

>
> Sorry folks, but during the same time Magic evolved much more. It has
much more? in what way? oh yeah the look is different.. Looks niiiice now ;)
That's evolution to you?

> If you Minters want users to use MinT/MultiTOS instead of Magic
> better start programming instead of telling people how much fun it is to
> use decade old apps.
As opposed to what? running GEMtrade 2.x whatever latest version for example? Where it crashes, where the interface is crappy? where the output is not even translated correctly?
Or using newsie getting corrupted FAT?

You're right, it is up to the users to choose, AT least we/atari have a choice, several even.. We should be happy and thankful.
But false advertizements in favor of Magic is NOT acceptable. Sorry to go against you on that one..

Merry Xmas to you all.

For motherboards with only one voltage (no MMX-ready) there are new
Winchip CPU's (240 MHz) with 3Dnow and a better FPU. Not good for hardcore
3D-gamer but fast enought for Win9x or "normal" games.

> beatiful AES, although I'm still not sure if I like the thick window-borders.

The point here is that Atari violates the GEM specs. Many mechanisms inside
the AES "rely" on the fact that the entire OBJECT is inside it's rectangle,
as specified by its ob_x, ob_y, ob_width, ob_height. The clipping and window
rectangle creation also exploit this. The 3D attributes as implemented by Atari
draw outside of that rectangle, this requires awkward and CPU intense workaround
code in the AES, as for each object they need to evaluate the attributes, and
all the ways to combine them to find out about the real rectangle.

This spec has been violated from the beginning by the SHADOWED and OUTLINED
flag, but apparently the 3D attributes worsened it considerably (probably
because they create a huge number of ways to combine attributes that draw
outside the rectangle, each must be considered). Andreas said by keeping that
workaround code much simpler this way, he saved lots of both space and CPU
time (one of the secrets why the MagiC AES are so fast ?).

> 1. Resources designed under MagiC looks bad under any other current AES with
> 3D-objects (obejct-borders often overlap).

This is kind of a compatibility issue which he probably had avoided if only
the beauty of the objects had been at stake.

I do not ask you to care, but I do. If we can get work done better, easier and
more efficient by undoing certain silly things, it's fine with me.

A problem I can live with (this one). If you can't, don't use MagiC.

But that's the whole point. MiNT can only run on more hardware because it lacks
the stuff for initialising all hardware.

Anyway, I reckon at some stage the rest will be reimplemented too, and MiNT will
only run on that hardware it was designed for. Just as MagiC. ;-)

It does. Setting flags as a program would do for MultiTOS will create 3D objects
in the same manner. The fact that they *look* a little different can not be used
to argue that MagiC won't support it.

> * MagiC does not have Pfork() (Note that this is something that has been told

Aren't the fork() functions just "new" Pexec() modes (I've dealt with them
directly) ? MagiC does support the MiNT Pexec() modes.

> * MagiC does not support Pexec(...100..).

It definitely does. I've used these in some of my programs.

Not to long ago I also had some bitter experience with the MiNT developers.
If Andreas had the same, no wonder there was no communications ... I know
Andreas can be quite blunt when telling his opinion, and stubborn too, just
what I noticed too about the (some) MiNT developers.

>> Apparently (indicated by the smile) you have noticed that this is one of the

He told me he tried. I don't know how it went though, but I can imagine the
MiNT people didn't want to argue because theirs was in place and working (the
Minix fs), and they saw no need (at the time ?)

> b) ...release documentation that's readable by the people that has developed
> most of the things that *use* these interfaces in MiNT.

Writing up docs is a bad task for a programmer, even in his own language. I had the impression his english is about enough to write some posts in the newsgroups. Imagine this situation, and imagine you had to write a comprehensive documentation for MagiC.

I fully agree it should be available in english, just pointing out how it could happen there is none.

> ...has not exactly helped MagiC. How many programs use these interfaces
> today? Spin and one or two ramdisks? It might be technically superior but if
> they're not used they're also worthless.

MagiC uses it internally too, it's GEMDOS is pretty much layered. Soon there will be a networked fs for STinG using it.

> What I *do* have problems with is MagiC's error-handling, it's a lot more
> sensitive than MiNT/N.AES to runtime-errors. My experience is that problems

> (and no, I don't use memory-protection in MiNT).

Which is strange too. I do all development under MagiC. Of course I often create bus errors, address errors and virtually everything else that's possible but it always terminates the new code under test with the rest of the machine unharmed. Few cases the code actually hit MagiC code, of course this can't be stable anymore.

> MiNT has always been stable here, I've used it since 1.12.6. Maybe you've
> been using MultiTOS?

Never. I do a lot with 8 MHz machines, with which MultiTOS is not usable.

When talking about MiNT, I mean MiNT + SingleTOS AES.

Cheers Peter

You can't be seriously trying to imply here that MultiTOS AES is bugfree ?

> Just don't say me again that MiNT

We were talking about MultiTOS, not MiNT, weren't we. Of course now you will
point out that MiNT is part of MultiTOS, ignoring that everybody would say
MiNT if he meant MiNT.

> privilege violation
> handler is buggy just because it doesn't allow STiNG to do dirty things
> you coded there (that ori #$00,sr nicely contrasts with your postulate

Show me where Atari specified that as forbidden, or just non recommended.
You cannot INVENT standards, that was Atari's. The method works perfectly,
and it will with all CPUs that follow Motorola's specs on this CPU feature.
It even does under MiNT, if STinG is started after it, so that it cannot play
it's dirty game with STinG's exception handler.

Remember we're under TOS, not Unix, we do not need to be in Kernel Mode
to exploit certain CPU features. And MiNT Is Now TOS, it's not : TOS Is
Now Unix. And under TOS it is legal to install exception handlers.

But forget it, that discussion annoyed both sides (well, me at least) badly.
I do not want to repeat it. I will ignore any attempt of yours to do so.

This has little to do with my satisfaction. Try to make me look like gloating over this, it's not true. I feel rather sad that the Atari world nowadays is such divided, but it's not only Andreas who is to blame as you inevitably want to imply here.

> but this is not true.
> The MiNT XDD/XFS interface will be kept. It doesn't make reentrancy
> impossible. This was TOSFS what it mainly did, and some routines at

What is proper ? That he uses your language ? I wonder how you'd look like
trying to write an OS' docs in german.

Don't take me wrong, I disapprove that there is no english version.

You cannot mean the doc's contents, as they are far better and far more compre-
hensive than anything I've seen for MiNT. Just to note one thing, he doesn't
point all the time to some for the usual Atari programmer hitherto unknown
operating system (Unix). Reading MiNT's docs is frustrating : "This and that
works just like it does under Unix." Thinks the programmer "Ah, good, now I've
got to learn programming Unix in order to just be able to read MiNT docs." I'm
sure this has driven many many programmers to go the MagiC way.

>> tearing it apart. I've heard it got some problem with some Falcons, Andreas

You're funny. I'm sure your grin would freeze immediately if something similar
(i.e. a bug that cannot be found while all one knows is that it is connected to
some strange hardware behaviour) happened to MiNT.

5011. Atari ST Gameboy Emulator

Newsgroup: comp.sys.atari.st
Date: 1998-12-23 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <75sc3d$f14@james.hwcn.org>
Source record: 87713

I realize that the Atari ST doesn't have the raw power required to emulate many of the older videogame machines like the Atari 2600, Intellivision, and Vectrex not to mention actual arcade machines like MAME does on the PC. And before some of you start flaming me and bringing up all the different computer emulators there are for the ST note I'm talking about videogame machines not computers. It's much harder to emulate videogame systems than it is to emulate a computer. I know that the ST can easily emulate the 6507 (same as a 6502 but without interupt lines) but it takes a very fast 586 to emulate the TIA chip in the old Atari 2600 and the custom chips in most videogame consoles are equally as difficult to emulate. Not to mention that a computer emulator doesn't have to run at full speed (unless you're going to be playing games on it) but a videogame emulator must.

Anyways, a friend of mine was telling me that there is a Gameboy emulator that will run, fully functional, on a lowly 8Mhz XT! I figure if someone can get a Gameboy emulator working on that dinosaur then I'd imagine a monochrome Atari 1040ST should certainly have the power to emulate a Gameboy. Has anyone ever thought about that? Anybody working on something like that?

5012. Any real ST stuff going on?

Newsgroup: comp.sys.atari.st
Date: 1998-12-23 00:00:00 UTC
From: ad329@james.hwcn.org
Message-ID: <75sc3d$f17@james.hwcn.org>
Source record: 87714

Does anyone actually still do anything for the Atari ST anymore? It seems like there are more people interested in stuff for the Falcon and TT and their clones than for the good ol' Atari ST. It seems like other ancient computers have more enthusiasts cranking out software from their basements than the Atari ST has. Has the Falcon and TT diminished interest in the ST? I guess since those machines are so much more powerful they attract the programmers because then they're able to write software that keeps pace with the stuff being put out for the modern PCs and MACs, but where are the people who are pushing the limits of a stock 1040ST (or even 520ST) just to see if it can be done? All I seem to see are posts about Falcons and TTs and desktops and operating systems. Maybe the really neat ST posts are buried somewhere in there and I've just missed them. It just seems like its been a long, long time since I've downloaded a program for the ST and been totally blown away that someone was able to come up with something like this on so limited a machine. I miss being able to proudly show off to my PC owning friends what my lowly 1040ST could do.

Maybe the reason there arn't enough basement dwellers out there cranking out stuff that pushes the limits of the ST is because the machine just isn't old enough yet to have that kind of devotion. Maybe in another 10 years time we'll see groups of enthusiasts springing up all over the net devoted to such a task like we have now for the 20 year old Atari 2600. I guess it's just not old enough yet to be driven by nostalgia. Or perhaps because the Falcon and TT are further evolutions of the ST few programmers have a desire to make software for the ST just as few PC programmers have any interest in supporting the 8088.

Anyways, if you are out there and writing software for the plain ol' stock Atari ST that pushes the machine to its limits, or even if you're just writing some stuff for the machine that falls under the catagory of "really really neat!" please step forward into the spotlight and make yourself known. Tell us who you are, what you're doing, and where we can find it. Don't be shy, it's time for the Atari ST programmers to come out of the basement and shout out proud, "We're here! We're ST programmers! We're not going to disappear! Get used to it!"

I'd really like to show something to my PC friends that would knock their socks off again.

> What is wrong with my PC? I have a fairly OK PC (374MHz CeleronA, 128Mb RAM,
> 8Gb bloody fast IBM-disk, 4Mb S3 graphics-card) running NT4sp3, and MagiC-PC

I'm really getting fun when I listen to PC users : they can tell you all the hardware there's in their case, but no-one tells you what they are doing with this marvelous and expensive thing (please don't piss me off saying it's inexpensive : I don't have to change my falcon every year to be "a la page")
When I listen to atari users, they speak about creation (not only programming). I like that.
So here's why I'll continue on atari : I'm eating PC-stuff all day long for living, I hate programming it (even though Visual C++ is far better than any dev environment on atari ... stay tuned on Visual Assembler ;-). I love 68k assembler, I love running GFA progs to try some news/stupid/brilliant idea (it depends ;-). And I finally bought the CT2, witch I plan to use in the next 4 years (that's inexpensive ;-)))

Eric

BTW : I followed the threads about Magic vs MiNT. Great. I was using Magic, now I choose MiNT (where can I get an AES in english or french ? I follow Xaaes workshop, but it seems "in progress" for a while, can I help ?)

> try to use Atari's specs to argue your way, it doesn't work.

first : No it doesn't. That's why everybody (who want to run on both magic and tos) have to provide 2 rsc and do some adaptation in the code. Magic has some "new" features that weren't on regular tos (actually, some were officially supported, but magic support them differently :-/
Second : I can't find any documentation about these "new features" in english. Where did you get yours ?

IMO she said exactly the contrary. She said she won't support magic because magic doesn't follow the official specs, as she does with mint. She even said she'll make an effort if somebody provide some docs in english.

Then, you probably have a 2 MB daughterboard, since the motherboard
has 2 MB by default.

You can replace your daughterboard with an 8 MB version, if desired.

Otherwise, there is a simple modification to replace the motherboard
RAM with bigger chips, to obtain 8 MB of ST RAM. This voids using a
2 MB daughterboard, though. However, the 8 MB daughterboard can be
combined, for a total of 14 MB (the last 2 MB overlap I/O adressing,
so they are "wasted", so you don't get the full 16 MB).

I use my Stacy and TT because I like them. There are a few specific
pieces of software that perform their tasks exactly the way I want them
(in a way that simply isn't suitable on the PC equivalent).

Then again, the hardware is begining to show its age, especialy
on the graphics front. I really could use a graphics card.

I have finally received my AixTT replacement, but since I installed it,
my TT behaves even more flaky than before the old AixTT died. Now, I
get MiNT "illegal instrucion" and bus errors regularly, to a point where
I have to reboot ever 20 minutes or so.

All the waiting for a replacement TT RAM card, plus the endless
crashes, makes using my Atari less and less enjoyable; I waste
more time tracking bugs (on a setup that previously worked just
fine) than actually getting anything constructive done.

I recall my brother commenting my TT crashes more often than his
Windooze. I'm begining to think he was right.....

I'm slowly checking all of my floppy disks, on one ST USER cover disk I found a text editor named scribe, after I ran the scribe.tos I run the scribe.prg, came up nicely on my TT, figured I'id give it a test, so I clicked on 'LOAD TEXT' and what do I get ...

OUT OF RAM!

Does this program use up all the ram? I'm running 4megs st ram / 4megs TT ram.

Make sure you choose the appropriate printer driver in Calamus. Make sure
you select "other" in the print dialog for the port to be used. Works fine
on my G3 to a Brother HL660.

Hello Everybody,

I'm pleased to tell you that to download Eureka 2.12 there now a more
adequate address. The official site is now :

http://eureka.atari.org

Eureka is a 2D Graph Describer and a 3D Modeller.
You can also download on this site :
- EB_Model 3.32A the POV III Modeller of Emmanuel BARANGER
- POV 3.02 Persistence Of Vision
- POV 3.10 The latest version
- Many animations of mine like :
- Bill Gates in 3D with a pie on his face, during his visit to Belgium
- An animated PacMan designed with Cyber Studio and rendered with POV
III
- Many POV III scripts
- Many VRML scripts (it's a pity that not any player exists on ATARI
platforms)
etc ...

Have a good visit, and marry chrismas to all !!!

See you soon for new news of ATARI battle front ...

: working on XaAES. Then I download the latest source, have a look at
: it, take a look at my schedule and then hide away the sources...)

Yeah, and that is the *REAL* problem, why Magic has taken the lead. In
1993, when Eric Smith still worked on MinT there was no question for me
that I would use MultiTOS, advancements were at that time incredible.

Six years later the MinT project IMO failed. Although open source, no real
advances have been made in MinT, the current version still is not much
more than a patched version of Erics MinT. Some XFSes were programmed
(2,3?), MinTNET completed (last update years ago), but this is
far too
little for such a long time period. From time to time, someone looks into
the sources, changes some glitch and that's it, major problems, such as
the TOSFS have not been solved after more than half a decade.

In addition, MinT cannot be called an open source replacment for TOS, as
integral parts of an Atari OS environment (GEM) are not supported. All
attempts to do so in the open source market have failed: Three
frewware/open source AES were announced, not a single one will be
completed in the distant future. NAES has been completed, but then the
same problem
with ASH programs: commercial, Support of English versions not up to what
has to be expected.

And noone even bothered to start programming a replacement for (N)VDI
and/or SpeedoGDOS.

The MinT users are really a small minority in the ATARI userbase, even if
we leave out MagiC and its derivatives. Just to give an example, STinG is
much more popular than Mint+MintNET.

Sorry folks, but during the same time Magic evolved much more. It has
come to a point, where I as user would even argue that Andreas and ASH
have the right to postulate new programming guidelines different from
those of Atari, if they feel that this is the only way for introducing
new advanced features.

I am die hard user of Atari hard- and software since 1987 and I will
continue to use these machines for a long time to come. Many reasons have
been given, and one I will add: The ongoing development of software.

Don't misunderstand me: There are lots of things in the MagiC world that have to be changed/added (better support for English etc.), but even more has to be done in the MultiTOS world.

If you Minters want users to use MinT/MultiTOS instead of Magic better start programming instead of telling people how much fun it is to use decade old apps.

Alfred

Yes, Byte was the only non Atari magazine to have a review of the Falcon when it came out. They were the only truely platform independent magazine that was focused on core technologies. Byte has helped me get a fundamental grasp of many things. I'm very sad and angry to see it go. Like you I can't think of any publication that is even similar to it.

Apparently it was Byte's lack of PC evangelism that made it hard for them to get advertising revenue (the main income for most publications) which led to its sale, despite the very healthy circulation figures.

The official MagiC site would be ASH's one in German. I don't know of
any other ones, except bengy.atari.org.

> The Neodesk/Geneva homepage is still up, and I hold licenses for both
> programs, so I shouldn't need info for those products.
>
> This is in preperation for a new page on my web site that will cover and
> review these desktop replacement programs/OS upgrades.

There are very few homepages that cover each single product, so I
suppose your idea is a good one.

>
> Where in the US can I go to purchase and/or register Magic, MiNT, Thing, etc.?

I don't know about MagiC or Thing, but MiNT is free. The main problem
with MiNT is the lack of a central resource center and a modern
distribution kit. All the links that I've found are either outdated or
dead, and ulsee you subscribe to the MiNT mailing list, you're more or
less on your own.

Does anyone working on the MiNT project know if there's a new MiNT
distribution kit in the works, with a modern MinixFS and MiNTnet
implementation, and a nice web page with all the info you need to get
started?

> (For example, ASH's homepage still lists Toad as the US distributor for Magic.
> I find that a little hard to believe, considering Toads recent poor attitude
> towards us Atarians.)

Toad no longer has any activity on the Atari platform. You should have a
look at best electronics, B&C, ATY computing, Bravo Sierra, people like
that.

From: louis@holleman.demon.nl
Message-ID: <3680dc946e9080@holleman.demon.nl>
Source record: 87773

Hello once more,

OK, for the time being the bunch IS running, but there's some problems I'd like to see fixed.

Basic setup is Mint 1.15 in the autofolder, running Gem.sys (AES 4.10) as the GUI. No Minix partition (yet; I'm waiting for another 1 gig drive to be sent back to me).

What happens: when Mintnp boots, it reports finding 4 Mb ST RAM and 64 Mb TT RAM. Should be correct.

Next Gem.sys comes in, this one launches Thing and my Accs, so far so good.

At this time Menuinfo is active and displays 3200 kb ST RAM and 4 Mb TT RAM. It means that Gem.sys eats up 60 Mb of my fastram, and it is no longer available to other apps (like Graftool).

I've been thinking about configuring Thing to limit mem use for Gem.sys, but first, it won't let me, secondly: Thing runs last. I gather by that time Gem.sys has taken the mem already...

Major Q: how do I prevent Gem.sys from taking 60 megs?
I fiddled thru' piles of docs again, but there's nothing on a "users guide" to Gem.sys. Others have been kind enough to give hints, but I need more extensive docs on it, like setting envs for the user. Also: how about a task manager? How do I kick out bad behavers? Are screen redraws possible? What key operations allows Gem.sys me to use? All zip/nada/nothing.
Go hack the keys and find out? CTL-ALT-TAB or CTL-ALT-ESC don't do nothing.

Info/docs on this would be greatly appreciated.

Next step: how to go on the Internet from here? People have been suggesting it should be possible from Sting. Well, I get it running, connecting and pinging and that's it. Launching any app and the system locks up. Do I need Mintnet or do I need Gluestik here?

And for those suggesting "Get N.AES!", I'm outta dough and that will remain so for at least another month.

Otherwise: it just looks promising. Fast enough, even with Gem.sys (maybe that's because it has 60 megs to operate in...)

You could just ZIP it up using ST-Zip and use the password protected option.
Most Atari users have access to ST-Zip (and I believe the password option is
compatible with Wintel Zip versions), if your intention was to send the file
to someone else.

For a much more secure encryption, but with a more complicated interface,
you should use PGP (Pretty Good Privacy). There are two GEM shells to this
TTP program that I know of, but I haven't tried either of them out. I
believe the last version of PGP available for Atari is 2.61.

Yes, there are actually 2 distribution kits in the works.
Obviously, I recommend that all MiNT users subscribe to the
MiNT list, if only to stay informed of recent developments.

Btw, the MiNT list is moving away from Umich. To subscribe,
email majordomo@fishpool.com with "subscribe mint" as message
content (without the quotes).

Recent MiNT developments:

1) VFAT & FAT32 support (floppy/hard-disk/removables)
2) built-in hard-disk caching (internal FATFS or new MinixFS 0.70)

Related recent MiNT products (or Unix ports):

Apache 1.12.6
RAMFS 0.54 (complete rewrite by Frank Naumann)
Pine 3.96 and 4.05.beta

There will soon be a MiNT homepage at mint.atari.org, which will
also be hosted on Fishpool. Myself and others are currently
gathering material for this (including: Eric R.Smith interview,
KGMD FAQ, Unix basics, etc.), but don't expect anything until
late-january... ;-)

The current centralized resource for MiNT is, and has been for
at least a year, ftp.funet.fi/pub/atari/ where there are two
MiNT archives: the main funet one, plus a mirror of the Piwo
archive.

Please, let me know if the problems are still there with the new release.
I'll try to look into this after Christmas.

>>In any case, I'll do my best to upload the latest XaAES beta7+ binary to
>>my ftp site before Christmas. This one has no problems with the Lattice
>>dialogs, which (IIRC) was still a big problem with the source release.
>>(I would have uploaded it yesterday, but I found a new strange problem
>> that I'll at least try to do something about.)

The problem has now been fixed and a new archive uploaded.
You'll find it as ftp://rand.thn.htu.se/pub/XaAES/xaaes7+b.lzh

I've not yet uploaded any newer sources, but I've verified that the
current ones compile fine under both Lattice C and GCC (I found the bug
with a Lattice version, but the released version is compiled by GCC).

>Looking forward to that one... :-)

I'm looking forward (really! ;-) to bug reports etc on this new one.
Most programs I tried it with had only the expected problems (the mouse
handling has some limitations in beta7, but most things work reasonably
well), but Orcs still crashes on startup (I believe there's some problem
with the handling of indirect ob_spec in the resource loader).

>I hate singletasking these days... unless I have to, I won't use it.

I had a Sinclair QL for a few years and switching to the single tasking
ST was not much fun (I needed the speed) but, as I said, it doesn't
matter for most things I use my Falcon for nowadays.
Naturally, I run Linux (on a Mac) and Solaris (SUN's UNIX) at work, and
Win95/Linux on my PC. I certainly couldn't live without good multitasking
on any of those machines!

>Another strange thing: last time I tested (august, september) XaAES test6,
>I found that it only worked by resetting program flags to "memory shared".

Since I can never run with memory protection on my Falcon, I haven't
really looked into what might happen with XaAES under such conditions.
I wouldn't notice if the default flags could cause problems.
(That's one reason why I need to hear from other people. ;-)

How are you going to run a BBS without a HD by the way?

>The second problem being, how am I to copy this thing onto a disk and have it
>be read by the ST... should I copy it onto an ST format disk, or a PC format
>disk, or am I screwed 'til I get an HD? Help... 8*)

Format a double density (ie 720K) disk on the ST, poke it into the
appropriate orifice on the PC and copy the file(s) onto it.

>Yes, this does indeed bring the graphics back on the Yahoo page! I would be
>interested
>in knowing what the problem was and how it was fixed without making any
changes to Cab?

No problem, it's really fairly simple.

Please excuse the spelling and grammar as I haven't had any coffee
yet this morning.

CAB now routinely uses an If-modified request method when
requesting resources from the web. This is just a request modified to
tell the server that we only want the resource if it has been modified
since a date we pass in the request.

Well the incompatibility comes with the following. As stated
before CAB routinely uses this IF-modified request method. Even if it
doesnt' have the resource already in it's cache. This is realy not a
serious problem as most servers are smart enough to deal with this. In
these cases CAB passes the equivalent of a date value of 0. So we are
requesting the resource if it's been updated since the 1970's. As I said
before most servers take this in stride and say sure this has been
modified here it is.

However the microsoft server that Yahoo has in place does not
behave in this manner. When requesting graphics in particular from this
server with an if-modified date of the 1970's it proceeds to answer. No
this resource hasn't been modified, meaning that we have the most current
version. Now this is kind of a rediculous behaiviour on the servers part
as I really don't think there are many resources on the WWW that haven't
been modified since the 70's. But since it told CAB that it hadn't been
modified, CAB was caught in it's own trap. It didn't have the file in the
cache so it had no graphics to display.

I was able to fix this behaiviour without modification to CAB by
supressing requests modifiers with a time value of 0.

on Wednesday 23-12-98 11:06, Gary Priest wrote:

>I'm looking for a program that will allow me to encrypt a single text file,
>so that in order to read it, you must use a password. Anyone know of such a
>program and where to get it?

There was a program in the EditPlus package which did just that. From the
original author's description:

Encrypting with EDCRYPT.PRG

This works the same way the old internal EdHak Encrypt commandworked.
In other words, when launched from Edit Plus, it only operates on what
is in the buffer, so do not try encrypting a file that is bigger than
the buffer! And don't encrypt something and then append it to something
else, since it will not then unencrypt properly (unless you only use a
single character as your password). If youfind yourself wanting to
encrypt files larger than the buffer, then just run EDCRYPT.PRG
separately from Edit Plus, then it will size its encryption buffer as
large as necessary for the whole file, up to the available RAM.
Finally, do NOT forget your password. I can not be responsible for
attempting to unencrypt a file after you have forgotten your password.
It _may_ be possible, but it would NOT be easy. The shareware fee for
this is $5 for those who are not registered Edit Plus users.

5050. New at Systems For Tomorrow (Dec 22nd)

Newsgroup: comp.sys.atari.st
Date: 1998-12-23 00:00:00 UTC
From: sales@systemsfortomorrow.com
Message-ID: <368144dc.899946@news.kc.net>
Source record: 87787

New at Systems For Tomorrow December 22nd, 1998
~~~~~~~~~~~~~~~~~~~~~~~~~~~

Holiday Special
Order $25 or more and add Midi Maze, Space Quest II AND Jack Nicklaus Golf to your order for only $4.99! (While supplies last, or till 1/1/99)

Holiday Schedule
We will be closed Dec 25th thru Dec 28th, and Jan 1st thru Jan 4th. Happy Holidays!!!

Aixit Magnum TT Ram Card $169 /w 0k
This latest RAM expansion card for the TT can accept one or two 16, 32, 64, or 128MB 72pin FPM or EDO SIMMs. Thus allowing up to 256MB of TT RAM using the 128MB SIMMs. Easy to install, just plugs into your TT RAM socket. For the TT030 only, from Aixit.

Squash It! $99.99 (till 1/1/99, then $129.99)
Squash it! is an amazing sample processor; with over forty different algorithms, you can instantly transform a single sample into a whole library of unique sounds...

There's a healthy supply of standard synthesis functions for starters; things like amplitude and pitch LFO, a four-pole amplitude envelope shaper, low and high-pass, and comb filters (FIR/IIR with resonance), and amplitude, phase, and ring modulation.

But Squash it! has a set of really unique editing tools too, allowing you that creative edge: processors such as Explode, Granularise, Smooth, Expand, Shift, Mosaic, Blur, and Erode, may all sound odd, but the results are amazing!

To polish off a sample, Squash it! contains a section of studio effects, such as the dual rack-mount Compressor/Gate, mono and stereo delays, harmoniser, time/pitch compression/expansion, and a rotary speaker simulator.

Squash it! supports the most popular Atari sample formats (AIFF, AVR, and Microsoft WAV), but can also load any other data using its raw import. In addition, samples can be dumped to and from an external MIDI sampler, with drivers for the Akai S900/950/S700/X7000, and the MIDI sample dump standard protocol. If this isn't enough, Squash it! also features extensive clipboard tools, disk-based Undo, sample-accurate waveform window, and digital audio playback (up to 50KHz!) on all Ataris.
~~~~~~~~~~~~~~~~~~~~~~~~~~~

From Electronic Cow!

Atari Computing #11 $9.99
Latest edition includes Reviews (Calamus SL98, Sound n Stuff CD, Select CD, Animation Players, Desktop Solitaire, and more,) Tutorials (Trackers, HiSoft BASIC, Papyrus, DA's Layout and Inside GEM,) Plus shareware reviews and all the regular features (including a sneak peak at the Milan.) Subscriptions and standing orders are available!

NVDI 5 for TOS Computers $99.99
The new English release of NVDI is here. A lot has changed with the new version. For starters, all the NVDI versions are combined into one. NVDI 5 can be used on your Atari system, or with Magic Mac or MagicPC. It also supports ET 4000, Matrix CX, Matrix TC, and Nova video cards! Also, new in NVDI is a huge selection of new Printer Drivers including: HP Deskjet 1100, 1120, 1200, 500, 540, 550, 560, 600, 660, 670, 680, 690, 820, 850, 870, 890, Cannon BJC 210, 240, 250, 4000, 4100, 4200, 4300, 4550, 4650, 5500, 50, 600, 610, 620, 70, 7000, 80, 800, 820, Epson Stylus Colo r 1500, 1520, 200, 400, 500, 600, 800, II, IIs, Pro, Pro XL, Photo, Photo 700, Atari Laser, Epson FX/LQ, varios HP LaserJets, and more. As usual, this new versions also provides more speed and compatibility then ever before. Note: NVDI ships on HD disks. If you need DD, please add $5. Upgrades from NVDI 3/4 are available for $44.99. From System Solutions.

Upgrade instructions: Send NVDI 3/4 Manual and Disks to: SFT - PO Box 3034 - Independence MO 64055 - USA. Include $44.99 + $4 Shipping for USA, $7 for Canada. Add $5 if DD disks are required.

GEMTrade 2.1 for TOS Computers $19.99
GEMTrade will take a German document and produce an English alternative. It also includes a lookup dictionary to find the translation of a specific word. GEMTrade can even function as a module for the CAB web browser. German web pages can be instantly translated while on-line! New version 2.1 now available. If you purchased 2.0 please E-Mail us about the FREE upgrade!

Running for Falcon030 $29.99
Running is a 3D shoot-em-up in the tradition of Doom and Wolf3D. Features good graphics, smooth gameplay and enough enemies and weapons to keep the warrior in you happy. From Running Design Team.

Crown of Creation 3D for Falcon030 $39.99
In the year 2060 the earth is in deadly peril. Two alien races threaten humanity. The only hope left is the newly developed LH14 space-fighter and you. COC-3D is a breathtaking true color space combat simulation that features outstanding Graphics, sound, gameplay and contols. Even has in film sequences. This is the

best falcon game we have seen in a long time, quite possible the best ever! From RebelSoft.

ExtenDOS Gold for TOS Computers $39.99
The latest version of the best CD-ROM drivers! Now supports long file names, CD-R and CD-RW drives. Also now will save a CD-Audio track directly to your Hard Drive with most drives. We offer upgrades from ExtenDOS Pro for $25 with the return of you ExtenDOS Pro disc. From Anodyne Software.

CD-Write for TOS Computers $39.99
When combined with ExtenDOS Gold, and a supported CD Writer, this package will alow you to create your owen CDs! For Cubase Audio users this is a Must have! From Anodyne Software.

Desktop Solitaire 1.02 for TOS Computers $19.99
Eight Solitaire card games in a GEM friendly application. New version now supports most video cards in 2,4,16,256 and 24bit color modes. Also includes several bug fixes, and the abitily to redeal the current deck. Upgrade DTS 1.0 to 1.02 for FREE, or check out the new demo, on the Systems For Tomorrow web site (look under Kordes Development from the main page.)

MidiPlay $49.99
This is a player of MIDIFILE without additional hardware for the Falcon030!! It plays the MIDIFILE with digital sounds! Features: Play all the MIDIFILE following the GM norm * Up to 24 voices on an normal Falcon * Each channel have a dynamic polyphonic voice. * You can change the sound of current channel. * Function SOLO (play only the channel), MUTE (not play the channel). * Viewing of volume, information for each channel, bar, time, etc...

Live Machine $64.99
Live Machine is a D2D program for accompanying someone during a concert. Live Machine can be controlled by MIDI messages! For the Falcon030.

Also Available:
MIDI Arpeddiator $27.99 MIDI sequencer
Sound Chip Synth $19.99 Software synthesizer
Snippit Synth $29.99 Granular synthesizer
Alien Thing (Expert) $19.99 Alien Blasting fun!
All Things Falcon CD $9.99 Tons of Falcon PD/Shareware on CD
Hard Disk Sentry $39.99 Optimize that Hard Drive
Photo Show Falcon $9.99 View Photo CD discs on the Falcon
Card File 4 $29.99 Personal Information Manager
Moving Pixels CD $29.99 Software Collection /w sources on CD
ESG Clipart CD $19.99 IMG, CVG and GEM/s clipart on CD
True Paint $19.99 GEM based paint package
Plus about 400 additional products for your TOS Computer!

The AixTT takes FPM and EDO, too - the design of the newer MagnumTT is nearly identical. You just have to make sure that you get symmetrical (rows == columns) DRAMs, and that you get 5V types (which is standard for SIMMs - however, a lot of crap is sold lately).

>16 Mb simms, ID xx1740x are OK

The same should work in the AixTT, too.

I really doubt that this is the case, have you checked with another
tool that you've *really* used 60Mb? I'd suggest that somebody mail
you 'ps' (I don't have access to my Atari computers now) so you can
check what's running and how much mem each process use. You can also
open u:\proc and check it, the filesize of each "file" (e.g.
processes) tells you how much memory they use.

> I've been thinking about configuring Thing to limit mem use for Gem.sys,
> but first, it won't let me, secondly: Thing runs last. I gather by that
> time Gem.sys has taken the mem already...

Thing is started by GEM.SYS (after all, Thing is an AES-application,
and GEM.SYS is the AES...) so this won't work.

> Major Q: how do I prevent Gem.sys from taking 60 megs?

My bet is that it doesn't, but check in u:\proc first.

> more extensive docs on it, like setting envs for the user. Also: how about
> a task manager? How do I kick out bad behavers? Are screen redraws

You can use a shell and kill processes, or use one of the
process-manager accs/cpx that's available.

> Next step: how to go on the Internet from here? People have been
> suggesting it should be possible from Sting. Well, I get it running,
> connecting and pinging and that's it. Launching any app and the system
> locks up. Do I need Mintnet or do I need Gluestik here?

STiNG will work fine, but beware that booting-order is important You
should first run NVDI, HS-Modem and what else you might want, then
MiNT, and finally STiNG.

Your memory-problem suggests that there' something wrong with your
system, so try to figure out where those 60Mb are first.

5054. CAB.OVL 1.3014 available

Newsgroup: comp.sys.atari.st
Date: 1998-12-23 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <75rb0j$90s$1@athena.netset.com>
Source record: 87791

CAB.OVL beta 1.3014 is available from my page now.

New fixes:

Extended parsing routines for redirections, the OVL now handles a
few more variant methods of receiving the new location.

Hopefully this will help with sites such as
htp://www.tweedehands.net/ and http://www.de-partikulier.nl/ in regards to
placing ads. It should have many other applicable locations aswell.

Hopefully it doesn't break anything.

location as usual: http://www.netset.com/~baldrick/

Dan

I was actually a guest of one of the MGI guys as the decision was being made. It shocked me, being a log-time Calamus user myself. It kind of put a damper on the evening's conversation.

My SL95 (Atari version) still cooks, and I'll never give up my 1.09N for quick bang-up layout jobs.

Hi,
does anyone have any original Thalion games for the ST that you wish to sell??

I am trying to get hold of some for the soon to be opened Thalion Webshrine.

http://Thalion.atari.org

If you have them, and dont want to sell them but could send me scans of the boxes then also get in touch.

Are you an Ex-Thalion member I havent contacted yet? If so mail me at Mailto:a1exh@hotmail.com

Cheers

Alex

P.s. These are the Thalion Games

-Warp
-Leavin'Teramis
-Magic Lines
-Dragonflight
-Chambers of Shaolin
-The Seven Gates of Jambala
-Wings of Death
-Ghost Battle
-Tangram
-Trex Warrior - 22nd Century Gladiator
-Lethal Xcess - Wings of Death 2 *)
-Atomix
-Tower Fra
-Enchanted Land
-Airbus A320 - European Edition
-Amberstar
-No second Prize
-Lionheart
-Airbus A320 - USA Edition
-Ambermoon

>like that?
>
> CRACKERS
> (Zelda on the ST from hell!!)

First of all, it doesn't take a fast 586 anything to emulate a
2600!! I ran a great emulator at something like 150% normal speed on a
fast 486 and it would've probably ran pretty decent on a fast 386
(well, maybe not).
Second of all, if you don't think the ST could emulate a 2600,
I really don't see how you think it could emulate a Gameboy! Even
though it was only b & w, the Gameboy is a much faster, much more
advanced system than was even dreamed of at the time the 2600 was in
use!
Third of all, I don't know what emulator your friend was
talking about, but, I'm pretty sure he's badly mistaken. I really
don't believe it's possible to emulate a Gameboy at anything
resembling playable speed on anything less than a fast 486.
While, I'm not saying it's not possible, I am saying it's not
very likely. I would like to be proven wrong though :-)

Windows 98 is around UKP 90, AFAIK. MagicPC is around UKP100. Hardly twice the price. NVDI-PC bundled in with MPC and Ease (though I've never installed the latter) cost me around UKP 140 all in. Expensive from one viewpoint, yes. I guess there's always one of the freeware emulators if you don't want to pay that much.

Well, no-one's trying to force you into buying anything you don't want. I would only point out that MPC is around the same price as Atari MagiC and NVDI-PC is around the same price as Atari NVDI. Many people (me included) bought both for our Atari hardware, so it's not that different buying both for PC hardware.

It could be argued that ASH's pricing policy is somewhat dubious (I'm not an uncritical fan of ASH), but then you don't have to buy their stuff if you don't want to. There are freeware emulators for PC, Gemulator too. Also running MiNT etc on your Atari hardware. Just take your choice.

Don't be. The ST clock doesn't start to hit any trouble until around
think it was!).

Of course, if you have software which only uses two digits for the
'year' you would find trouble earlier.

Why would a musician worry about the date anyway? Nothing you are
likely to run is going to be sensitive to the calendar year.

Crash on and enjoy :-)

Consider yourself proven slightly wrong. The work of the Resevoir Gods continues to amaze and wow Falcon owners accross the pond all the way over to the states. They have created GodBoy and GodleNES, Gameboy and Nintendo emulators for the Falcon. I'm not sure if/how fast they would runon a standard ST, but most games run okay for GodleNES. And it's not yet a true emulator from the standpoint that it takes the binaries and runs with it, rather, they convert games to separate stand-alone programs (about 15 or so for GodleNES so far). Now, I haven't used Godboy, so I have no idea how fast it runs on a Falcon let alone if it will run on an ST. But, what better way to find out than to try.

You can download the games and see more information at http://rg.atari.org. Their work continues to push the Atari scene forward, plus they seem like they're having a hell of a lot of fun doing it :)

Hope that helps,
George

5070. ** Announcement: Login v0.11 beta

Newsgroup: comp.sys.atari.st
Date: 1998-12-24 00:00:00 UTC
From: quantum@voicenet.com
Message-ID: <EWvg2.788$fk.7814071@news3.voicenet.com>
Source record: 87657

Greetings, and a happy holidays to all. Just wanted to
announce a new Login version. Here's a snippet from the History file:

======
History

December 20, 1998: Version 0.1 Beta released.
o First beta release.

December 24, 1998: Version 0.11 Beta
o LOGIN.PRG will no longer be written to configuration files, nor
changed by login. Could have caused a problem if you changed
your own config file and forgot to include it (like I did while
testing).

Merry Christmas to all, and to all a good night.
Keep a smile,
George Garner

Tony is taking a break for a couple of months from the internet. I am
in very close contact with him - any messages for him, please pass
them through me.

However, to see his latest project, take a look at either
www.paxton.cyberstrider.org
or
web.cyberstrider.NET

Merry Christmas to you all too. :)

Written in a hurry my previous post ended up sounding like that. I
donï¿½t think you deserve to be flamed, I think it is unfortunate with
software not compatible with newer system and OSï¿½s, but find it great
you support atariï¿½s anyway. Really.

> Point proven already :((

hehehehehe, in a way I suppose they do :)

> graphic, isn't photoshop enough for you that you need to run papillon or
> such?

There's Photoline for the ST, I believe it's a superior package from what
I've heard.

> games, hmm games don't run in magic, and PC for games are rather
> interesting.

Yup, the classic games, running on a 128mb pc... Sorry, not enough free
RAM, go free up some more :P

> WHat makes atari fun?

I get a Hi from using it :)

> What makes atari attractive?

I know that when I flick that power switch, it will load :)

> What makes me still loving it?

Well, I don't know what your reason is, but mine is because is has been so
reliable, it does everything I want, and I've had it do lots and lots of
things, and I'm treating it to some extra RAM and a new disk drive :)

> Those are the questions, probably too hard to answer.

Well, I just answered them, what does that make me... don't answer that :)

> Please, do not ruin my hobby by taking away the few users there are left
> already, I won't have the pleasure to share my passion with
> anyone else anymore...

umm, passion? share? ME :P

I suppose this is the bit where I have a go at MagiC, but as it's so close
to Xmas, I am being nice and I'm not saying anything until 26th on the
matter.

So, from me, Have a Merry Christmas and a Happy New Year :)

Chris,

Someone is working on Java but the work has only just started and may be only in the prep stages. Note: JAVA and JAVASCRIPT are not the same thing. Java is useful for building applications. Javascript, which looks similar is useful for doing some dunamic (meaning non-sttic) things on a web page.

Wow! Glad to hear it. I didn't mean that I didn't think the
Gameboy stuff couldn't be done on an ST or Falcon. What I meant was I
don't think a Gameboy emulator could be done on a lowly XT machine! I
should've been a little more clear. I also think Chris is REALLY
overestimating the capabilities and the complexity of the old 2600!
I'm really glad to hear that people are still doing this sort
of thing on the old Ataris though! I'm busy playing with my new super
system (P2-450, 128Meg Ram, 13 Gig HD, CD-RW, etc., etc.). Sorry to
gloat, but this is my first new computer in about six years and I went
all out. After running on my old 486 for so long, I feel I've earned
it!
As soon as I get my computer room straightened and organized,
I'm going to pull out my old 800XL and 1040ST systems and set them
back up too! Long live Atari!

>I simply gave up trying Sting on Mint :-(
>
>
Hhhhmmmppfffff,

tell you the truth: I'm really getting p.... off by this, it's going to
spoil my Xmas...

So I spend a few hours downloading the basic Mint stuff from Funet.fi
So I spend time fetching docs/whatever from Katherine's site
So I spent lotsa time reading the docs/installation procedure, not once,
not twice but perhaps 10 times.
What I spent on getting Mint/Gem.sys decently to work, I won't mention.

So I clean up a Syquest cartridge, at least I can create a Minix partition.

Next I reboot, clean, nothing but a bloody ST-Low screen and double-click
KGMDINST.TOS.... (SAme shit in TT-med clean)

After an hour or so I still wait for anything to happen.... one blinking
cursor, after the text "This is Freemint 1.12.4-beta..... Use this at your
own risk".

ZIP, NADA, NOTHING.

Hey, I f..... pay my phone bill by the minute, my Dad doesn't pay for me,
I get no free college Internet Access,

AT least MagiC/ASH gave me an installation for my money spent (and a
working OS, but I won't mention that last one)

Yeah, well, Lewey, you done something wrong...! Oh yeah?

1. Fetched KEMD.ZIP, unzipped into I:\KEMD\
2. Got INSTFLPY.ZOO, unzooed into I:\KEMD\
3. Downloaded BASIC (a thru u plus cks plus chk) into I:\KEMD\
4. Downloaded NET (a thru g plus cks plus chk) into (you guess) I:\KEMD\
5. Doubleclick on KGMDINST.TOS in I:\KEMD\ and n-o-t-h-i-n-g !!!

Thank you very much! I think I'll stick to the non-compatible MagiC then!

Ooops, I nearly forgot: Merry Xmas too! But you got the picture...

|
|The Mega ST doesn't even havea RTC (real time clock), if I recall. That
|means that is doesn't even have any awareness of what date it is.

it has a battery backed clock, and no, there is no problem after 2000.
i've tried it.

problem is now that i've ditched the old megafile and replaced it with a
larger drive (ICD driver, but no real-time clock), the internal clock is
ignored, and i have to type the time in! oddly enough the time which comes
up is the time & date the machine was switched off.

it must be something to do with the HD driver, but id on't know what.

BOLLOCKS BRYAN.

My standard 16mhz Falcon runs an emulator of a faster system than a Gameboy - an NES system. Many games run at playable speeds. Also by the same authors there is an emulator called a Godboy which does the same trick with Gameboy games.

I don't know what sort of PC my Falcon compares with, but it certainly isn't the equivalent of a 486.

Admittedly a Falcon is a faster machine than the ST, but I still ran emulated games on my ST when I had it. Gameboy emulators didn't abound, except for one that ran Gameboy Tetris very well, even drawing a picture of a Gameboy on the screen and played the game in the window as if you had the Gameboy there.

Next time check your facts before insulting these fine machines - AT LEAST ATARI COMPUTERS DO NOT HAVE THE MILLENIUM BUG.

Cheers!

This one looks a bit odd (to put it mildly!), but the other ones are
OK, atleast if you're using truecolour.

> SCREEN 010 1968
> ST-GUIDE 014 56944

> Totalling up to 6306544, so where's the rest?????

I really can't tell... Perhaps there's a bug in the MiNT-kernel (it's
still a beta), or the GEM.SYS binary is corrupted.

>>Your memory-problem suggests that there' something wrong with your
>>system, so try to figure out where those 60Mb are first.

Well, GEM.SYS only use 1.7Mb (most of it is used for the
quarter-screen buffer that's really huge with graphics-cards), but it
looks like there's a problem with newdesk. What happens with another
desktop?

> Perhaps Mint is not "latest-model-Aixit-card-compatible" (you listening,
> Martin-Eric?), or is my RAM not Mint-compatible, or my TT, or is Saddam

I very much doubt that MiNT would have problems with your RAM-card if
it works in TOS and MagiC.

[snipped off lots of frustrations...]

Trying to install KGMD with little or no knowledge of MiNT, little or
no experience with MultiTOS, no unix-knowledge and little or no
patience is actually more optimistic than my mom when she tries to fix
her car herself...

KGMD is a highly complex system, and there's a zillion things that can
go wrong during installation. Be patient, or stick with what you
already know.

Bad karma? I know a lot of people that use STiNG with MiNT and
MultiTOS/N.AES, and my own experience is that it works very well once
it's correctly configured. Setting up STiNG can be a bit confusing, I
remember being very frustrated when I installed it on my Mega ST
running MagiC 5.1x.

I don't think this is correct, what he said was that he wouldn't
change his current implementation (catching the critical error vector
and provocing errors to task-switch internally IIRC) just because it's
considered risky and unsafe by some people (I'm one of them). STiNG
itself works perfectly with MiNT, that includes AES 4.10 which I've
used on my TT (don't ask why...). I don't know if it works with the
original MultiTOS.

That Peter does not seem to be too fond of MiNT and the MiNT community
does not come as a surprise to me considering the rude and partly
personal attacks on him on the MiNTlist some months ago.

> hacked together. works. hmmm kinda,, I gues so,. many people got it to
> work, but not me.. Probably something I have missed..

No, don't use this. If you don't want MiNTOS/MinixFS then you don't
need MiNTnet either. STiNG works, but it's a bit hard to *get* working
sometimes.

That's true, but you can remove the batteries and just use a CPX or
desk accessory control panel to set the date. Even with the Mega clock
running, you shouldn't have to worry for many years to come anyway. <g>

bad hey? ;)
I have kgmd on cdrom. Quite nice, no need to waste time downloading.

>
> AT least MagiC/ASH gave me an installation for my money spent (and a
> working OS, but I won't mention that last one)
Ok, you're going to far.
1) If you don't know how to code in C, you either learn, or you don't use.
You just don't blame C itself because you can't compile or code anything,
Get the point here?
2) Magic gave a full installation, no hassle? well, always look what you
get, in example, TOS in your ROM requires NO installation at all, gives
you full GUI, with icons driven etc. So, why even bother with magic when
your TOS is already there, "free" and no need to install anything?

3) I guess that makes all the MiNT users hyper-super-duper-Geniouses
then...
MiNT is an OS for the people with College degree in computer science,
right?
Whoaoh. I am more intelligent that I thought.. damn I am good...

You know, on irc, there was (a long time ago) a topic set to:
"Magic is for those who couldn't figure out MiNT"
I guess it is still applyable?

>
> Yeah, well, Lewey, you done something wrong...! Oh yeah?
Well, since you have started to install multitos before kgmd, you must

have a C:\multitos folder already, or C:\mint then?

But of course, if you've read the documentation like 10 times at least, I
am sure that you've checked that this folder is empty..
Right?
you've checked, hey?
I am sure you did, coz you wouldn't be so positive on the fact that MiNT
is crappy and that a fault/mistake from your sid is impossible, as you
said earlier, you read all the docs at least 10 times.

>
> Thank you very much! I think I'll stick to the non-compatible MagiC then!
You're welcome. At least, that's 1 more user that supporting a commercial
company for atari. Nothing wrong with that. But well, that's YOUR
computer, that's your stuff, that's your files (important data probably),
You must have a very deep confidence in the quality/reliability in magic.
That's good. After all the stories I have heard and all my BAD luck with
Magic, I couldn't understand why would anyone keep on using Magic, Well I
guess I found my answer... Some people are happy with what they got, Look,
Win95 or 98, ever tried that? My friend nonchalantly reset his pc quite
often, no prob, just netscape crashed, explorer while vieweing GIF
(builtin' win98 function) lock the whole computer, then after a reboot,
had to clean the harddrive, coz win98 couldn't reload..
My friends lives with that no prob, To him, that's the only thing he knows
really, a computer crashes, oh well, that's normal.
NO it is NOT. I find that amazing that people accept that.

>
> Ooops, I nearly forgot: Merry Xmas too! But you got the picture...
Merry Xmas to you, sorry if MiNT sucks.
Sorry for all the troubles you had.

From: Aliceavia <aliceavia@yahoo.com>
Message-ID: <75s9bmeat1@plug.news.pipex.net>
Source record: 87719

Hi all,

Having recently purchased an old MegaST(4mb) from a friend so that I can compose my music in real time, I am now a little concerned about Year 2000 and AtariST's compliance.

Does anyone know if I should be concerned about this?
If so, does anyone know of a good fix program and where to get it?
Is there one on the net somewhere?

I know this subject has probably been done to death here before, but as I said; I'm new to all this....

Any help is appreciated.

Many thanks in advance.

Alice(ia).

You can't be seriously trying to imply that magic/sting are bugfree,
are you?
First rule, there is no 100% bugfree software.

> We were talking about MultiTOS, not MiNT, weren't we. Of course now you will
> point out that MiNT is part of MultiTOS, ignoring that everybody would say
> MiNT if he meant MiNT.
MiNT should be considered as the layer, basic kernal. On which you should
only be using N.Aes. Talking about MiNT or multitos as being the aes found
in the ROM, is like starting a new thread on Magic (implying version 1.x).
Let's talk about what's relevant. a decent AES with decent kernel.
Hence Magic latest, MiNT latest, decent aes (N.AES or at the worst/least
AES 4.1 gem.sys), latest STING. Coz in this case, we can all say that
sting doesn't support PAP, CHAP, and NOT even PPP (If I refer to the first
(BETA?) version). Anyway.. just to prepare the ground for further
discussion in this thread.

> This has little to do with my satisfaction. Try to make me look like gloating
> over this, it's not true. I feel rather sad that the Atari world nowadays is
> such divided, but it's not only Andreas who is to blame as you inevitably want
> to imply here.
"such divided", well, several OS, several AES, several standard, several
tasks, what do you expect?
How about kde/gnome ?
how about win95/Os2
That's a phenomenom well expected.. Is it a good thing? or a bad.. I don't
know really. How about the STIK compatibility in STING? very very close I
admit. But NOT 100%. At one point the programer has to make a choice.
This little tiny difference is what's gonna make crash the application.

Now, 3 internet layers? maybe 4?
All that worthless code over the years.. All those applications lost or
not developed anymore..
Who said, "I will NOT support MulTITOS" several months ago.. I believe it
was you Peter.
Who said Katherine is bluntly refusing Magic compatibility? I believe it
was you, few days ago.
In which I never said that, That I would make a fix when possible, WHICH I
did 2 days after the first release. Just for magic users basically.

Points:
1) I understand that magic author can not /doesn't want to use MiNT,
because Magic is commercial, and can not use mint part directly,

Copyrights? GPL?
Something like that..
2) Magic supports most of the calls (all?) of MiNT, and AES 4.1 and such, but have unexpected behavior.
pexec 100 DOES exist in magic, but afaik blocks the parent.. which should not.

Same for menu_popup() or was it form_popup() ? don't remember exactly, but it reacted weird.. When using listbox maybe? sorry I can not be more precise here,, been a while I didn't use magic.. So yes, it is there, but in a weird way.

3) The RSC when built, looks AWEFUL when optimized for magic but ran from different AES. Even overlapping objects etc. What does that mean? means that under any OS other than magic, some application are sometimes not useable, can't even read the dialog.. When the program itself has nothing to do with magic OS. Can be a simple calculator program. Looks ok in magic, but NOT even useable in other environment. This is all against compatibility/backward compatibility. Makes the job of coders much harder than it should be if they want to remain compatible. (or they just use very simple RSC, no 3d, no nothing, in which case will work everywhere, but will look crappy everywhere also.).

4) Folx, if you have less than 2meg in your atari, Magic might be a good alternative. I don't deny that.

5) Magic is commercial, and I am happy that still a company is making money out of some atari software, so it is NOT my goal to destruct/annoy these people (ASH, Kromke). I hope they will sell for many years to come more magic versions. I, for my part, have been there, and don't want to deal with them. But that's just me.

6) That said, Freemint is a reality, I much rather see people NOT supporting commercial software by using freeware, Rather than using PIRATED commercial software, if you see what I mean.

(think about that one)

Hi Katherine,

a good guess, as you've probably seen by now.

So next is the Internet: up till now (so even now my mem problem is
solved) I cannot use Sting for the connection. That is:
It connects just fine, then when pinging it's 100% OK too, but that's it.
Start Newswatch, I click "retrieve" and it sits forever with a busy bee.
No way to get out of that, or go to another app. Can't activate any other
app. Same with Popwatch. Same with aFTP. When I let Sting run the login
batch (to set my clock), I get an "exit 2560" message and the system
freezes.

I guess just for the time being, the question becomes: how to set up
MintNet without the Minix drive? I got the whole basic and net stuff/files
for Mint, plus the KGMD/KEMD package, but I've heard this one *needs* a
Minix partition. Can the Mintnet stuff be done without the Minix? Or is
there a fix to get Sting running with all the apps? Like now it runs, but
that's it. (Yeah I know, I'm terrible...)

> solved) I cannot use Sting for the connection. That is:
Sting author, (Perot) said few months ago, He would not support Multitos.
I don't know much.
But see, in general people want mintnet but NOT mint. which I can
understand.
But the other way around? wanting mint but NOT mintnet is a little weird
:)
I heard some people with Naes that got Sting to work. You better ask them
more directly.

> I guess just for the time being, the question becomes: how to set up

> Minix partition. Can the Mintnet stuff be done without the Minix? Or is

You're best bet then is to find pppkit. It doesn't need a minix, kinda
hacked together. works. hmmm kinda,, I gues so,. many people got it to
work, but not me.. Probably something I have missed..
Probably hard to configure, because it was meant to be all longfilenames,
might want to try with vfat? I really don't have a clue. And somewhat the
easy solution is to just simply do a minix partition.

Anyway, no matter what, if you have a free partition available, (at least
40meg big), just create one. And yes, you can install GEM applications on
it, And yes, it is fast, and reliable.
Only drawback is from singletos, you can not access it.. It is there, just
can't open your minix partition. That's the only prob. That's why most of
the time you will not install GEM application on it, because these GEM
applications, you mightwant to run them from SINGLETOS also. So unless you
ONLY run MINT all the time (like I do), you can have ALL your partitions
(except boot (C)) minix.. But well, here I only have a 400Meg partition
for minix. That's PLENTY.
what you could try though is minix a floppy disk (1.4meg), then install
what can fit on it, that require longfilenames (.ppprc and such also).
Then sym_link them where they should be.. That might work, But you need to
be a genious, Working at N.A.S.A ? ;) ;) ;)

nah, just need to be familiar with sym link, and the filestructure..
Once again, kgmd was made to ease the task. And does pretty well..
But if you don't have a partition to spare, well, a little

harder/complicated.

Anyway, bye.

From: atari@bright.net
Message-ID: <75suhigbk1@cletus.bright.net>
Source record: 87726

It has come to my attention that some people have been having problems with aIRC not saving and/or loading it's config files. The problem apprears with MagiC. I had several requests that aIRC should support env $HOME and since I use MiNT I decided to add this. This is where the problem begins. So far the people with magic that had problems also had env $HOME set and didn't know it. Not only that it was pointing to a non-existant path. I think c:\gemsys\home or something similar. Why? You tell me.

I don't know if magic itself installs this env $HOME path or some magic aware application. So if you have the problem stated above either adjust the path as needed, or remove the env $HOME completely.

There will be no update of aIRC to correct someone else's problem.

Normal in Tt is: 2 Mb ST and with the Atari card an extra 2 Mb, makes
4 Mb.
But when you put in different memory chips (lot of soldering) you can
get twice as much.

I believe Best Electronics has the chips and other parts needed.

From: paulfinch@my-dejanews.com
Message-ID: <75tbd5fhl1@nnrp1.dejanews.com>
Source record: 87728

I have approx 500MB of Atari data on a SCSI 540MB hard drive (which I took out of my broken Mega STE) which I would like to read/transfer onto my MMX 233 PC, via a external SCSI hard drive, SCSI one cable connected to a Future Domain SCSI 950 card (inside my PC) and using a Atari software emulator. I do not have the software drivers for the Future Domain SCSI 950 card but Win 95 has recognised the card, but the nearest driver it has, is for the Future Domain SCSI 850 card. Which I have set it upto and guess what, it found the SCSI 500MB hard drive and put a icon up on the desktop.

So why can I not access the data then via this icon?
All my Xmas card lists, letters, etc are on the Atari 500MB hard drive.

Please can someone help me!

The Mega ST doesn't even havea RTC (real time clock), if I recall. That means that is doesn't even have any awareness of what date it is. If ever I'm wrong, and the Mega does have a clock, then don't worry, it will happily keep one ticking until at least 2028. At worst, you could reset the date to anything you want, since music software doesn't give a damn about the date either.

>

Very wrong. I have found most software that people discuss here to be
very friendly to my old STe. Maybe limiting things to ST/STe support
will result in flames. I think it should.

There are so few atari-users left, so I think we canï¿½t afford to shut
the door for any users, where compatibility could be achived with small
efforts. Therefore, I think ie. avoiding GEM is very unfortunate as this
shuts the door for almost all newer TOS-machines. Not smart at all IMO.

BTW, I donï¿½t think this group will survive if it would be ** ATARI-ST **
, and nothing else. But to most people ATARI says more than TOS.

Iï¿½m not a good programmer, but Iï¿½ve started writing a hear trainer for
my STe. I have made sure that the software will run under SINGLE-TOS as
well as with multitasking, both N.AES and MagiC.

Take a look if you want, at this URL:

http://hem1.passagen.se/gokmase/atari/

If anyone finds this idea interesting it might be a good thing to know
that NETSCAPE has taken a new approach to browsers with their new
browser-kernel, GECKO, which has been released as alpha-software. This
thing will (when finished) be a stand-alone browser with NO extra
goodies, just be small (fits on a HD!) fast and modular. :)

Look at mozilla.org for info.

Can we all use the same OS. Proably not. Some of us need a multi-user OS, like myself. I have not used MagiC, but was told it was not capable of this. I was told by the owner of Computer direct that it was the best OS he had sold, and he sold many copies. But it may be best as a so called plug and play OS. Sorry to use this term, but for many people, trying to install an OS like Mint or Linix is more work than they are willing to do.
The point is, we have more than one choice of OS, like it or not, and these choices may help to keep the Atari world alive.
In a perfect world, we would be able to purchase an OS that would do everything all of us wanted, but thats not the case. Windos tries to do it, but does it succeed.

My recollection is different :) The Mega does have a RTC. Look on your Megafile (if you have one), and you'll find the battery compartment. The Megafile used the same case as the Mega ST.

Whether the clock is Y2K compliant - I don't know.

>Where can I find a good y2k-compatible CPX-clock/setter?

I tried the expandable control pad in version 1.31modifi, and it
interprets "80" as 1980, but all 2 digit years lower will be inter-
preted as "20xx" - so I cn't see an acute problem in setting the
date.

The data on your atari hard drive is not compatible for dos/win file system.
I think the easy way is to read out this drive while using another atari.

Same as i use magiCMac, atari drives are ONLY avaiable if MagiCMac runs..
I don't know in witch way your emulator accept atari drives.
But i think the device must be a dos/win device, after that you
can use it as atari software device.

Don't chance anything, you lost your data!

Witch hard disk driver do you use by your atari device?

If you have an "normal" falcon you can take the 16Mhz version..

If you have an accelerated atari (falcon), take the 25, better the 33Mhz version.

Hi,

well, after a good night's sleep, I started rechecking everything.
According to the docs, everything what's supposed to be there, IS there.
One might discuss the mint.cnf file, that both unarcs from the KEMD_R2.ZIP
archive and the INSTFLPY.ZOO archive, but these basically are the same.
Same can be said for all the textfiles. So it leaves the other ones.
At the moment I can't somehow link to Funet.fi, so I can't check the
filesizes, but the BASIC and NET files "look OK".
Furthermore, since I'm installing from I:\KEMD\, I do have an *empty*
Multitos folder there. Even on C:\, from where I can run Mint/AES4.10
already I renamed "Multitos" to "Multitox.001" and created a new, empty
"multitos" dir. No xdd, xfs or whatever files on both roots. I even unzood
the instflpy again to a floppydrive. Then, after a *clean* boot,
doubleclicking KGMDINST.TOS brings a screen with "This is Freemint somuch,
some more, and the last line "Use at own risk".
The following line has a blinking cursor and that's it. Can't even get out
of it. Slamming ESC, SPACE, RETURN, ENTER just zip/nada/nothing.
So I figure my Kgmdinst.tos is defective.... Only logical explanation.
When I look into Mint.cnf, it should say some more after that.
This happens when trying to install from I:\KEMD\ and trying to do it from
the floppy. I guess I mite try to get the instflpy.zoo archive from just
another server, perhaps it was coincidence, perhaps the one at funet.fi IS
defective....

But for the moment my kitchen is more important :-), gotta fix my Xmas
dinner and I love to fiddle around in my kitchen, so Mint is now for the

spare time. Good Lawd, I've got these wines sitting and waiting now, don't wanna even THINK about Mint for the moment. Better think about garlic, onions, the swordfish ready to be grilled and the Meursault to go with it. Well, maybe some mint to go over the swordfish, then....

Sure, for every pot there is a lid.

The thing is: under the same conditions as you I had to use that font
for a while.
But somehow I could not distinguish between 1 and l sometimes. With
awfull results.
I have multi-focus glasses: my eyes do not work as I want them.
With the Atarai System Font I can read everything from the screen
from a distance of 1.5 meter. I could not with the Monaco.

No true anymore since MiNT 1.15 series. We are getting pretty
close to a point where GEMDOS will be completely sepersceded by
MiNT. You really should download the current archive and try
it for yourself. ;-)

> When talking about MiNT, I mean MiNT + SingleTOS AES.

Ahhhhh! There's the problem, right there:

Most MiNTers imply N.AES, not MultiTOS. I doubt anyone on the MiNT list
is still using MultiTOS, except for the ocasional test on AES 4.1, just to
compare behavior of new code.

English is _not_ my mother language.

However, as both myself and Ronald Anderson recently pointed out, it
should be understood that English is the de-facto communication language
in technical fields. Swedes who study in technical fields are expected
to be fluent in English; so are Finns, Russians and Zulus.

> You cannot mean the doc's contents, as they are far better and far more

Well, it has/is happened/happening to MiNT also.

The Falcon is probably Atari's most imperfect product ever made. You
really should talk to the Centek guys about this. It's hilarious.

However, there are many Falconists on the MiNT list, so we people
try to fix it collectively.

I seem to recall that Andreas still doesn't have a Falcon himself.
That should be fixed in the first place. It would help him and
every Falcon user who prefers Magic. ;-)

On 23 Dec 1998, Alfred Radauer wrote:

> And noone even bothered to start programming a replacement for (N)VDI
> and/or SpeedoGDOS.

Hmmm... Hmm....

fVDI exists. It _is_ a VDI replacement for MiNT, which includes
a TrueType driver. Soon, it might also include PostScript type 1.

MiNT itself is _very_ close to completely replacing GEMDOS.

Please, don't make the same mistake some MiNT users do about Magic;
at least get the latest MiNT info, before commenting that Magic has
evolved so much more. ;-)

However.....

I do agree with you that MiNT only evolves here and then, whenever
someone actually bothers debuging a part of it. I won't deny it.

BUT....

Please bear in mind that Magic is a commercial product, while MiNT
is nowadays developed by Unix specialists during their spare time,
as a hobby, so there is no release deadline or anything. HOBBY. ;)

Message-ID: <Pine.LNX.3.96.981225130529.28778H-100000@hal.fishpool.com>
Source record: 87614

There are several utilities to set the TT RAM flags. 2 flags:

1) Load application into TT RAM
2) use TT RAM for program data

These flags are similar to the usual DOS flags (system, archive,
read-only, hidden), but apply only to Atari stuff.

However, some applications (mainly those who access audio/video
hardware) do not handle TT RAM well.

On Thu, 24 Dec 1998, Stephen Cavender wrote:

Doesn't the word "Free" in "Freeserve" say anything to you?

yes and i will have anything for nothing

>what magicly happens that can't just be passed allong to others to
>fill in

>Don't know what you mean by this TBH.

ok you have made Joe Bloggs xxxxxxxx by signing up with a pc,you take
some details on a floppy put it in an atari and you have freeserve

could you then send me this to alter to Kevin Dermott xxxxxxxxxxx?
or is it a one phone number thing,

>i can see this lot going like early sky tv all of a sudden it will be
>2quid for this bit etc

>Then it'll be time to go back to Zetnet, CiX or whomever.

they may not be there by that time, forced out of business
at this point freeserve can ask 4quid for this bit etc

>I'd be interested in getting one if they are reasonable enough.

a hard one to answer i got a bargain i think with a 14meg nemesis
three drives a cd and a ton of software for 150ukp

but then i hear of a four meg for 25 quid

then i see a very big setup for 500ukp he might have spent thousands
on it but,that was then this is now

it seems to be being in the right place at the right time,some people
change platforms,and just want rid some think they are sitting on some
sort of goldmine

>>2quid for this bit etc
>
>Then it'll be time to go back to Zetnet, CiX or whomever.

That is always supposing they are still in business ! I have this
feeling that it is all too easy to be tempted away by free offers that
only serve to put others out of business, then the survivers can, and do,
charge what they like.

I have always received excellent service from Zetnet, and appreciated
the Atari support I get both from them and the Zetnet Atarians.

Talking of support - many thanks to all on this group for all your help,
often from messages that were sent to help others. It is good to be in
touch with so many Atari enthusiasts, regardless of whether you use
Mint/Magic/Single Tos or whatever :-}}

A very Happy Christmas to you all.

Paul

>Well, maybe some mint to go over the swordfish, then....

Now that sounds great - we've just had a very traditional English meal
with Roast Cockerel (most have Turkey I know, but the Cockerel I think
somehow has more flavour - and I got it cheap off a friend :-}})
together with Brussels Sprouts, Belgian Beer (thanks Martin) German wine
and plum pudding.

How about the rest of you on such an International group, this might
prove to be a thread with even more mouthwatering suggestions than the
latest Atari developments :-))))

(Or has the alcohol loosened my typing fingers ??)

Cheers

Paul

Hi,

well, at least I've enjoyed Xmas, mainly the food (yup, all made by myself), not the weather, and now I'm back on trying to get this Mint stuff installed.

Just went back to funet.fi, checked the filesizes (least thing I could do) and everything appears to be OK.

So fetched instflpy.zoo another time, deleted the old items and unpacked again. Same shit.

Tried by deleting all the items that came from KEMD_R2.ZIP, still nothing. So what's in my KEMD folder now: all the basic files, the net files, the files from instflpy.zoo and that's it. NO extra dirs, so the "net" and "basic" files are just in "KEMD" (as the manual told me).

Running kgmdinst.tos just gives me the screen as described before with a blinking cursor sitting there forever.

So what? Did I miss anything in the docs? Is my kgmdinst.tos sick? Do I need the files from KEMD_R2 or what? Docs say to unpack these to "KEMD" as well, but when Ure installing from a floppy, they're not there (as I gather). Anyway, it makes no difference here.
Anyplace else I could try to get a working kgmdinst.tos? I've tried a few other sites, but this file (instflpy.zoo) is not available at other sites I've seen.
Meanwhile I fetched the "manual" dir too from the site. Plus the "tools". I've seen a file "minttl01.tos" in that one... Well, I gather that's not for installing mint.

So, here I am, sitting with 10 megs of installation files plus an installation program and I'm just getting nowhere.

Paul, well, IF so, it certainly has loosened mine too :-)

Tell you, I started early in the afternoon (after all, I am the cook and I
have to eat it and enjoy it, so I take my time for that).

OK, so Unca Lewey had this:

(I won't reckon the cheese platter beforehand)

- Shrimp cocktail - (very easy recipe, but buy FRESH ones)

- Vegetable soup a la Luigi - (it actually comes in a dozen
or more varieties, but I still like it after all those
years)

- Grilled swordfish, boiled potatoes, Broccoli plus
another Luigi speciality, the SAUCE. I still like to
make it from ancient recipes.

- Tiramisu, something Italian and very sweet.

- Cafe cappucino

All this accompanied by a '94 Meursault and a '97 Eiswein (this one being the first time in my life, and I'm a wine lover/connaisseur since the 70's).

Gawd, I haven't even started on the Port yet!

And for tomorrow the menu is:

- well, let's not Tantalize everybody here :-)

I really don't understand why you can't install the KGMD stuff. I,
probably the greatest computer dummy of the whole world did managed to get
that thing running. I install the package on my TT030 and on my Hades. On
the Hades I had to ask some help but nevertheless its up and running now.
If you carefully read Katherine's docs and following the instruction word
for word nothing can go wrong.
My guess is that there is something terrible wrong with your whole setup.

I also read you can't use STing with MiNT. Crashes all the time. On both
my machines Sting runs happily with MiNT. No probs whatsoever only aFTP
Stik version seems to have a problem but this has nothing to do with MiNT.

I hope Santa Claus will bring you N.AES so that you can forget MagiC.

Chris, use the Metaxbs.prg from the Spin package instead of Metados. I use
the Spinmagx.xfs in my extensions dir for MagiC, the combo gave me access
to small case and long filenames on CD-ROM's. Too long ago to remember how
to set it up on non-MagiC systems. Suggest you read Spin docs :-)

I didn't read that into his statement at all. In defense of all who post here, I don't think there has been much anti-ST sentiment if any posted to the newsgroup (although I don't know what's been E-mailed to you personally). And the above statement, I think, was meant to say that limiting the *newsgroup* to ST-only support would be a mistake. It should equally support everything from the very first original ST users to Falcon and TT users to Hades, Milan, and emulator users as well. No point in bickering over who's machine is better or should be more supported when our systems already have limitted support and user base as it is. You'll only make the few on the border of abandoning their Atari's cross the border.

MAC mostly uses SCSI so I'll bet you just get a SCSI adapter for the ST
and hook em' up. Check for a 50pin centronics connector on the back, or
maybe the less standard DB25pin connector that Mac sometimes had. That
should be an indication of whether or not it's a SCSI device.

Beware though, I've heard of some Mac peripherals having difficulty
working with the ST. Mostly a CD-ROM drive.

Later...

Chris Cracknell (ad329@james.hwcn.org) wrote:

: Does anyone actually still do anything for the Atari ST anymore?
Sure, but it isn't really what they are doing for a living thus it takes longer to produce. I'm doing an HTML tool right now, but working and making a living takes priority so it gets put on the back burners when I'm busy.

: Maybe the reason there arn't enough basement dwellers out there cranking
: out stuff that pushes the limits of the ST is because the machine just
: isn't old enough yet to have that kind of devotion. Maybe in another 10
: years time we'll see groups of enthusiasts springing up all over the net
: devoted to such a task like we have now for the 20 year old Atari 2600.
: I guess it's just not old enough yet to be driven by nostalgia. Or perhaps
: because the Falcon and TT are further evolutions of the ST few programmers
: have a desire to make software for the ST just as few PC programmers have
: any interest in supporting the 8088.

It takes a lot of time and effort to make a good GEM based program. Not only developing the algorithms that work, but comming up with a usable interface. Heck just learning how GEM works is a challenge (an enjoyable one though).

I just inheritied an Apple IIc+, that userbase is nearly eroded to nothing, the 8-bit Atari userbase isn't anything like it's former self. I suspect the ST will end up in a similar manner. Still not an excuse to stop using and programming with them, but it's a shot of reality just the same.

As for TT/Falcon development, that's where pro-level users are likely to be so stuff gets written for those machines. Also the new clones are likely driving development in those directions.

Later...

If you're using MiNT or MagiC you may give SPIN034 a try. IMHO the best CD
driver around. It works just great on my MiNT system. A friend of mine
could only read CD's on his Falcon with SPIN. With the other
(non-commercial) drivers it was impossible.

Take a look at the UTSI pages (see sign-off for URL) for a download
address. Just follow the 'Mint' link.

Don't know if it will work but get a demo copy of the SELETRIC fsel and
intall it - go to options and choose lower case. It may let you read 'em

Hi, can anyone supply some URLs to Atari sites that contain ST demos? I am after a wonderful demo called the European Demo, but have not been able to find it anywhere.. :(

I'm using a Macintosh, so the emulation-format will need to be in ".ST" or ".MSA" format. Thank you.

Just a thought, but it'll involve spending money.... ;-))

MagiC has a VFAT long filename filesystem which is compatible with
Win95. Its been available at least since version 5, so you could get a
second hand one, or splash out on the latest version 6.

It involves running a program which enables you to select which
partition(s) to set it onto (baring in mind that TOS doesn't like long
filenames).

On my system I only have it set on the partition that has my Web cache
on it, which is handy because the Net has lots of long filenames
within websites. Obviously you would also set it for your CD drive as
well, and then you can access it ok.

Cheers!

Hi all!

Does anyone know if its possible to run Civ from Hard Drive on a
Falcon?

I have the Civilfix program that is supposed to let it run from
floppy, but I haven't tried that - Civ runs best on a HD.

I've also tried Backward III (which incidentally now has a public key
available, email me if you want it) but I couldn't get it to work.

My Falcon is a standard speed one with 14mb of RAM.

Cheers!

Martin-Eric Racine <q-funk@pp.fishpool.com> spake thusly:

Q > There are several utilities to set the TT RAM flags. 2 flags:

Q > 1) Load application into TT RAM
Q > 2) use TT RAM for program data

Q > These flags are similar to the usual DOS flags (system,
Q > archive, read-only, hidden), but apply only to Atari stuff.

Q > However, some applications (mainly those who access
Q > audio/video hardware) do not handle TT RAM well.

And there are some programs (mostly old ones) on which the option to set the flags is grayed out (greyed out, for you English English types) on the cpx I use to set flags. I note that SARA/Groliers is one of these; if it were possible to run from/use TT Ram, I could see a lot more pictures with less trouble. A sizeable picture in the encyclopedia will crash SARA. If I boot 'clean', thus freeing up a lot of ST Ram, SARA rarely (never?) crashes. Another good reason to invest in more ST Ram for your TT.

I just recall me that I couldn't install KGMD on my Hades. There was
something wrong with the RAM disk. If I'm not wrong kgmdinst.tos installs
a RAM disk to extract the archive and so.
What is the problem? I don't know. Is it because the RAM disk doesn't run
on the Hades or is it because it doesn't like graphic cards?
You've a graphic card isn't it? Maybe you could try to install KGMD in TT
high or in whatever native TT screen mode.

Anyway on my TT030 I did the installation in TT high. Then I copied the
whole stuff onto a ZIP and copied that on a minixfs partition on my Hades.
I had to change a few things because the minix partition on my TT030
hadn't the same drive letter as the minix partition on the Hades. I also
had to disable the virtual console. This very nice feature doesn't work
with graphic cards AFAIK.

If this is acting the way that the TT's clock does, what you have is a battery that is a little low, or slightly low voltage for the clock. In a TT, if the battery is missing or dead, you get the TOS ROM default date (sometime in 1990?). If the battery is in somewhat reasonable shape, you get the last machine switch-off time when you restart. With good-to-excellent batteries, it works as it should.

I had the battery in this TT replaced with a new 3.6V lithium, but it is not quite enough. My wife's TT has a 4-AA battery holder (6Volts, nominal) stuck on the back of hers, and it works perfectly, even with fairly old batteries in it.

No! NO! NOO!

You get Bilge, billg, err.. you know who to innundate said enemies of the state with "free" copies of Widows 98, and "carelessly" leave a few thousand Intel systems at strategic airport terminals where stuff is known to be "temporarily mislayed".

That will cause similar amounts of damage to enemies-of-the-state - and it'd cost a bit a few dimes less. And it may even help Master Gates lose the title of "Worlds Poorest Person"

Meanwhile, those of us using an "A Team" computer system can continue doing so, safe in the knowledge that we're immune from this Wintel virus.

Martin,

as I already explained, I did a *clean* boot, which means there's
absolutely nothing running but plain TOS, no accs etc. So then I'm running
on monitor nr. 2, in ST-Low and I can switch to TT-med. Doubleclicking the
install.tos results in a few lines being displayed and a cursor blinking
all the time. I can wait till next year, but then it's probably still
blinking and nothing has happened. My guess is this tos program is
stinking, defective or something. Doesn't come up with a warning like
"files missing" or "faulty setup", it just sits there doing nothing.
As long as I can't get to a good one I'm not getting further. Haven't
found another site yet where I could try it.
The instflpy.zoo was unpacked with the Zoo214.ttp from KEMD-R2.ZIP...
I could give it a try with another zoo ttp I've sitting around.

Hi Joerg,
I've got a Adimens ST plus manual here but never actually used the
program. The manual has a German index but sofar I haven't
exactly found what you're looking for. (There is a section that
mentions *.INX, *.REC, *.DFN, *.DCL *.LNK, *.VEW files that form the
database.) Which keywords - in German - should I look for in the
index? If you want you can mail me in German. Cheers, Joost.

It sounds really like the problem I had when I tried to install KGMD on my
Hades. My guess is that the RAM disk for some reason isn't installed at
all. I wonder if someone has succeeded to install KGMD on a Hades.
Without RAM disk no installation.
ramfs.xfs must be at the root of your bootpartition at boottime.

Maybe a newer ramfs.xfs may help you. There is one on the Belgian ftp site
193.190.205.13/atari/incoming/mint/filesys/

BTW: ftp.lip6.fr has KGMD too. The problem is that that site seems to be
down for the moment.

5205. Atari Falcon FOR SALE-USA

Newsgroup: comp.sys.atari.st
Date: 1998-12-26 00:00:00 UTC
From: bsummer@delphi.com
Message-ID: <ZFVUQqq.bsummer@delphi.com>
Source record: 87639

Atari Falcon For Sale:

Atari Falcon with 84 meg internal HD,14 megs of RAM,
math co-processor installed, and RGB,VGA monitor adapters,
with manual and box. HD is loaded with all ORIGINAL
Falcon software, inc. Atariworks, plus much more.
Price in USA $650.00 plus shipping/COD.

I also have the external TOAD Syquest 88/44 hard drive,
which was a perfect complement for backing up internal
HD. The Syquest will write to 88 meg carts, and read 44
also.It comes with cable, and 7 - 88 meg carts.
There's a 14.4 ext. modem if needed.
The price of the Falcon and external HD stuff is
$775.00 plus shipping in USA/COD.

If there is anyone in the NYC area, that would be interested
in picking up the Atari Falcon, instead of mailing it, I will include
an Atari SC1224 monitor in excellent working order, for
free.

If interested, please leave Email for Barry Summer at:
bsummer@delphi.com

Happy holidays, everyone!!
Barry

5206. lowercase filenames on CD's

Newsgroup: comp.sys.atari.st
Date: 1998-12-26 00:00:00 UTC
From: chrisc@zetnet.co.uk
Message-ID: <762qdl$hn9$1@irk.zetnet.co.uk>
Source record: 87640

Hi Folks,
I've got a CD with a load of lowercase filenames on. How can I read them with a TOS4.04 Falcon running the SoundPool fixed version of Metados 2.7? Is there an alternative driver or an OS patch or something.....I suppose at a pinch I could go back to work adn force the Win95 machine to do something about it and re-burn the CD, but that will take ages and I could do with a generic fix anyway...

Many thanks for any advice....

>Kevin
>

I Don't think he does, as the ROM's he uses for the switchers are twice the size of the standard ROM's (they need to be to get both OS's in)...

BTW, I have a good working copy of TOS2.06 that I use with Gemulator at work, assuming you already own a TOS2.06 machine and are not going to use it simultaneously with the emulator then it would be very hard for a court anywhere to convict either you or the person who sent you the image file for piracy. You own a single use license if you own a set of legit TOS ROM's, if you are only using one copy at a time then you should be OK, or at least no lawyer would want to try and prosecute it...

Hate to depress you guys but I picked up my second Falcon (I need one art home and one in my studio, I don't use PC's anywhere) in exchange for a bunch of BBC's that I rescued from being dumped....cost me about 20 quid in postage I guess for a TOS 4.04 (spare 4.01 ROM) 170Mb (spare 65Mb) 14Mb (spare 4Mb) Falcon with some bits and pieces....now it's in the studio with a 16" screen a 2Gb HD and a CDR unit....
If I see one going cheap I'll tell the list, though the guy I do music with wants one as well ATM so he can use Squash and other software that we use in teh Studio at home...

For those few that don't speak German, I'll translate to the best that I can.
He's selling an Atari ST with an HD and a laser printer, and lots of software.
I think it also says there's some spare parts to fix the printer, or something
along those lines. And he's selling it for 400DMs.

> From a flop I copied a program (split.prg it was) to RAM-disk.
> Double clicking in the Thing desktop did not activate the program!!!!!
> From the flop it worked ok.

> And that is VERY funny behaviour.

But nothing strange. If you didn't copy the file with a program which is aware that there are filesystems with and without file permissions, it was most probably missing the x-bit (executable) on the RAM-disk, whereas on floppy (FAT, I suppose) there are no such permissions, so the responsible filesystem flags all files as executable to the kernel, to be on the safe side.

Ciao

Thomas

5212. Milan - what would win it for me.

Newsgroup: comp.sys.atari.st
Date: 1998-12-27 00:00:00 UTC
From: spencer@SPAMTHISmaelstrom.freeserve.co.uk
Message-ID: <36864acb.1868531@news.freeserve.co.uk>
Source record: 87496

I was talking to someone the other day about the possibility of my finding a machine to replace both the TT and Afterburner equiped Falcon in my affections.

In the course of the conversation I realised that there is only one possible machine which could fulfill this role, and it isn't even available yet, but with the hope of such a machine appearing here is my list of machine desires.

The Milan comes across as a highly desirable machine in my view baring two (maybe three) points. These are:

1) While a 68040@25Mhz is highly desirable to most Atari owners I would love something like a 68060@60Mhz or above. The reason for this is that you can never have too much speed and on that front I have now got used to my Afterburner/Nemesis equiped Falcon running a 68040@40Mhz. The potential loss of speed would be too much to suffer.

2) I want SCSI! This is more than a possible snobbish desire to avoid IDE. I would like to be able to use my existing SCSI devices from the TT and Falcon (not only drives but also CDROM's, tape drive, scanner).

3) This is not so much a requirement but rather a desire. I would love to be able to run Magic on the aformentioned machine. I have grown familiar with Magic now and although I have used the likes of Mint and Unix I do prefer the simpler, consumer friendly Magic environment.

Apart from these the Milan would present an ideal upgrade/replacement for my TT and Falcon (saving space in the process ;-)

Spencer

Does it from hard-disk then, or only from floppy? I've had it running
from floppy, but its much better on hard-disk, due to the amount of
disk accesses it makes.

BTW: I tried to reply to you by email, but the mail just bounced.

Cheers!

>
> PS That dinner sounded nice! ;-))))
>
Ronald,

it tasted nice too :-)

But, to remain with my problem: I am really getting nowhere. I used the KEMD_R2 archive from Kellis' page too, together with INSTFLPY.ZOO and the BASIC and NET files from Funet.fi. Some of the files from Instflpy.zoo and Kemd_r2 are the same ones, but I don't see this can be the problem.
Then again, when trying to install from a floppy - after all, if you'd unpack Instflpy.zoo to a floppy you get an installation disk too - it doesn't do a thing either.
The Install TOS just starts, displays the first lines together with a blinking cursor and that's just as far as it goes. I did move the whole bunch to C:\KEMD, but nil results too.
So now I took the problem to Maus.computer.atari.mint_mtos and also to the old FAN net on the BBS I still logon to, since I know a few guys over there have been playing around with the KGMD distribution.

I have one more option: move all the files to my ST and it's own HD and try it from there.

One minute later: Gawd, on my ST the floppy starts running the installation!. I think I *may* have found the problem...

(To be continued)

Source record: 87505

The endless Freemint set up story, part .....

New development: while I wrote back on Ronald's message, I said "try to do it on the ST". So, I ran upstairs, switched on the bloody old ST and tried to run straight from the floppy: doubleclicked KGMDINST.TOS, which in fact kicked me back to the desktop instantly. So a defective TOS?
Now, my ST is set that it first boots from floppies, then on a reset it goes from the HD (which runs from Hushi).
I reset, did a clean boot again and started KGMDINST.TOS again: this time I got a whole bunch of messages displayed on the screen until finally it quit again. Probably because lots of files were missing? Maybe because it's a 1 Mb machine?

Next thing, back to my TT and changed the HD driver to Hushi as well (that's easy done here). Well, guess what: starting up the floppy in this machine will give me the "forever blinking cursor" again!

Just to make it complete: the ST runs TOS 1.04, this TT TOS 3.06.

Who's gonna explain THIS???

Thomas, don't tell me.....

The KEMD distribution file(s) tell me to create a new dir anywhere, and
create a MULTITOS dir on the boot drive and _leave it empty for now_.
Then the docs tell me to unpack the archives into the KEMD dir and also
put the BASIC and NET files in there. So that's what I did!!! Don't tell
me ramfs.xfs and minixfs.xfs are supposed to sit in \MULTITOS.....

I'm just gonna try this, but IF this appears to have been the problem, I
suggest that Katherine IMMEDIATELY corrects the docs for KEMD!

Good Lawd Almighty.... it better be true (or NOT true, from another point
of view)

Well,

putting those xfs files in C:\MULTITOS and I:\MULTITOS did NOT get
KGMDINST.TOS beyond the blinking cursor.

The problem must be this TOS program itself.... Why da heck does it run at
least further on my ST, and sits with the blinking cursor on my TT?

Another problem: the only other server I know of having a KGMD
distribution is Lip6.fr and their KGMD dir is unaccessible now...

Yes but a person who owns a set of TOS2.06 ROM's that have been legitimately produced (ie original ST ones or licensed like the TUS upgrades) has a license to use that version of TOS. As long as you are only using one copy of that TOS at a time then the original owner of the TOS may not append restrictions to the license after you have bought it. There were no pltform restrictions on the original TOS so use an image to run an emulator happily, just don't turn on your ST at the same time...

Acorn computers were hired by the BBC to make a computer for an educational series back in teh 8-bit days. They're good little computers for an 8-bit, lots of interfacing, optional software in EPROM, very expandible, but still very old and rather hopeless, blown into the weeds by a 520......

5234. Falcon modem2 problem

Newsgroup: comp.sys.atari.st
Date: 1998-12-27 00:00:00 UTC
From: Jan.De.Smedt@village.uunet.be
Message-ID: <766aoa$c0k$1@nickel.uunet.be>
Source record: 87518

Hi,

I`ve got a Falcon 030 with Mighty Sonic accellerator and 16 MB RAM + 4 MB TT RAM.
I`ve also got a 3com PalmIII. Communication between them is handlded through
the Pilot Tools by Rodolphe Pineau, a freeware MiNT/Linux port.

http://www.chez.com/stratos/pilot.htm

For speed I use N_AES 2.1 #970302 which I bought on the Neuss Atari Messe.

Just a few days ago the PalmIII refuses to link with the Falcon.
It did OK for months.

I verified with Profile2 system analyser: de default com is now modem1,
it used to be modem2, as it should be. Even if I use SET_DEV7.PRG, wich is
supplied with Profile2 it still stays at modem1.

However, communication with my modem still is fine, faxing & internetting OK.

MODEM.CPX has the out port on modem1 and greyed out (disabled).

auto folder:
DRVIN .PRG 3.923 bytes 17.05.94 (HSmodem07)
SCC .PRG 8.756 bytes 08.06.96
MINTNP.PRG 191.097 butes 25.11.98 (FreeMiNT 030 1.15.1-0.3)
work fine

N_AES.CFG
..
export PILOTMODEL=PalmIII
export PILOTPORT=/dev/modem2
export PILOTRATE=38400
export PILOTBACKUPPATH=L:\PalmPilot\Backup
..

Could This be a hardware failure?
Can anybody help me please?
If anyone is interested in digging into this, please e-mail me and I will
attach a profile2 report and N_AES.CFG to the reply for analysis.
I haven`t done it now so as not to slow internet down (aprox 85 kB).
I`ve sent a copy of this msg to Woller Systems & Rodolphe by e-mail.

Merry Xmas and a happy New Year!
Greetings,
Jan

That is true, but Alfred has a point in that for indeed a long time nothing
happened with MiNT. People lost during that period will be very hard to get
back. Additionally, the very person people identified with MiNT (Eric Smith)
left Atari, and even if the MiNT developers outperform Erics contributions
now, this was somewhat a signal to many MiNT users that MiNT would be dead
soon. Actually this happened to me too, there was a time when I used MiNT
more than MagiC.

I haven't. Looks to me as if you MiNTers have a problem getting news around.

I had heard of some attempts to create VDI replacements, but to my knowledge
they are no more complete than the open AES replacements.

This is a bad comparison, as MagiC just as well is developed in spare
time, and just by a single person, whereas the MiNTers like to point out
that since it's open many people work on it. Considering these points, the
speed of development has been far more impressive for MagiC for many years
(not counting the last year as apparently a lot has been done with MiNT
recently), and it's during these years that lots of users have gone to
MagiC.

I haven't mentioned the 100% figure ;-)

I can very well compare the "buggyness" of MultiTOS AES (which is what "MultiTOS"
means to me and others - MiNT I would mention separately) and MagiC, or, as you
want it, STinG. The MultiTOS AES doesn't look very good in such a comparison,
you won't deny it I guess ;-)

I agree. But tell me why you say one should use N.AES instead of MultiTOS AES.
Because MultiTOS AES is ..... buggy ?

> How about kde/gnome ?
> how about win95/Os2
> That's a phenomenom well expected.. Is it a good thing? or a bad.. I don't

Ok, but with this kind of criticism you say there should really only ever
be one system, since only then such tiny differences do not exist.

> Who said, "I will NOT support MulTITOS" several months ago.. I believe it
> was you Peter.

Yes, for the same reason you say one should only use N.AES with MiNT.

> Who said Katherine is bluntly refusing Magic compatibility? I believe it
> was you, few days ago.
> In which I never said that, That I would make a fix when possible, WHICH I
> did 2 days after the first release. Just for magic users basically.

What I said was a little different, but admittedly it went into that direction.
I said that, because I just read some postings of yours where you compared

MiNT vs. MagiC programming issues, but exaggerated some a fair bit. And it looked (to me at least) that these were meant as reason to not actively support MagiC users. Which is what I said, and which is different from "bluntly refusing Magic compatibility".

You've proven me wrong here.

> Same for menu_popup() or was it form_popup() ? don't remember exactly, but
> it reacted weird.. When using listbox maybe? sorry I can not be more
> precise here,, been a while I didn't use magic.. So yes, it is there, but
> in a weird way.

One has to add the submenu functionality it to the system explicitly if needed by copying a file to some position. This may be called a strange way of installing it, but it cannot be used to claim it's not there.

> 6) That said, Freemint is a reality, I much rather see people NOT
> supporting commercial software by using freeware, Rather than using
> PIRATED commercial software, if you see what I mean.

I see the words and think I understand the meaning, what what has this to do with the current discussion ?

Katherine I really think we basically agree on most (if not all) points, and it's just our slight disposition towards one (not the same) OS that makes us take each other the wrong way here. I know you're not that far from supporting MagiC (or STinG) as you look(ed ?) here, while I also might look more against MiNT as I really am.

Oops, I really had thought so. But then you were in the good situation of
living in a culture that pretty much supports learning english thoroughly.
While in this respect Germany is a lot better than China or Russia, german
culture is far behind scandinavian or canadian culture. Lots of english words
are used in german speak nowadays, but *speaking* english is not exactly
encouraged. For instance why learning english if even movies get translated
to german (with often hilarious results for people speaking english).

Reality still differs a lot, at least in Germany, and I'm absolutely sure
even more in Russia, and whereever Zulus live ;-) What is really required
(by everyday demands) is english *reading* which is entirely different from
speaking.

Note I'm still not excusing the lack of english programming docs, just ex-
plaining how it might have happened there is such lack.

> I seem to recall that Andreas still doesn't have a Falcon himself.

That is certainly right, but I can understand that he refuses to buy each kind
of machine, as Andreas is not a professional software developer (I believe there
are none left on the Atari market - although like to be proven wrong).

Cheers Peter

You need to look at your settings for images. You can now travel the
internet with out the billboards (advertisments) in CAB 2.7.

Glad to hear you have the English version perhaps it will hint the USA soon.

You can change the boot order with HDDRCONF in the 'Device configuration'
dialog. Just drag them with your mouse to the desired position.
It might just be that your CD and Quantum (S2 and S4) are deactivated here so
they are skipped during boot up.

Ha die Louis ;-)

In order to make MYFONT.FNT your systemfont change your ASSIGN.SYS as follows:

```
01p SCREEN.SYS
MYFONT08.FNT
MYFONT09.FNT
MYFONT10.FNT
MYFONT20.FNT
```

add an 's ' like this

```
01p SCREEN.SYS
s MYFONT08.FNT
s MYFONT09.FNT
s MYFONT10.FNT
s MYFONT20.FNT
```

and do so for every 0xp SCREEN.SYS. With NVDI 4.x or higher you can toss VDIFONT
in the bin (the dustbin that is, not some odd BIN-folder ;-)

I think the issue here that the ST newsgroup is filled with what amounts to litter for users of actual STs. If the Apple II newsgroup was filled with iMac issues, a person might reasonably question what was going on in there.

I don't envy or dislike the newer TOS machines (nor their users), I look forward to having some someday. But other orphaned computers have their newsgroups where those few users left can get together.

ST users are orphans in their own newsgroup.

Jeff

Tony pretty clearly stated that trying to limit this newsgroup to what its name implies should be flamed.

> In defense of all who
> post here, I don't think there has been much anti-ST sentiment if any
> posted to the newsgroup (although I don't know what's been E-mailed

> say that limiting the *newsgroup* to ST-only support would be a
> mistake.

It would be a tough position to argue that limiting the C.S.A.ST newsgroup to ST information would be a mistake. This is not supposed to be a TOS newsgroup. And although there's not any blatant anti-ST mentality, there's certainly a huge amount of posts here that are meaningless to users of original STs.

In a perfect world, C.S.A.ST would be ST information, and perhaps there would be a C.S.A.TOS for these other machines. But it seems clear that users of primarily or exclusively ST machines are the minority, therefore logic be damned. I'll just keep hitting the "mark thread read" button waiting for something actually useful for an ST user to appear in the ST newsgroup.

yesterday I had a remarkable observation about tha Ram-disk I am
using with the Mint.N.AES setup on TT. (\mint\ramfs.xsf of 6067
bytes)
From a flop I copied a program (split.prg it was) to RAM-disk.
Double clicking in the Thing desktop did not activate the program!!!!!
From the flop it worked ok.

And that is VERY funny behaviour.

The Atari ST should be able to directly use IBM formatted (720K) disks. You should use a DS/DD diskette. Format the disk on the PC using the 720K option. Copy the ST files to the diskette, then use the diskette to copy them to the PC hardrive.

I don't know anything about transferring the files from the PC to the Mac.

I don't know whether its available on the Web, but I have it in my PD collection.

I've MSAed and Zipped it up and sent it to you by email. Not having an ST anymore (I have a Falcon) I don't know whether it still works, but you can try.

SoundPool did not change MetaDOS. What they did is that they supplied
their own BOS driver.

Depends on what you are using. If it is ISO9660F.DOS it's quite possible
that it doesn't work properly if it encounters lowercase filenames
(please check your config.sys and report what's in there).

Other MetaDOS DOS drivers like HS-ISO.DOS or the several XFS solutions
for MiNT and MagiC should work properly.

> Just a thought, but it'll involve spending money.... ;-))

No, because this has nothing to do with how CDs are handled.

Even if Atari as a company might be gone, it's intellectual properties
still belong to someone. In the case of TOS, it's (AFAIK) Milan
Computer.

Great.

Here we have yet another "my OS is better than your OS" flame war, and
it will lead to nothing.

Both MagiC and MiNT have advantages, and lots of things have been said
about them.

I will only say a few sentences about the XFS interface, because I am
one of the few people who have actually contributed XFS for both
operating system.

1) The MiNT XFS interface is easier to use and offers more
functionality.

2) The MagiC XFS interface might be more efficient when programming
in assembler and applying it to a DOS style file system (that's
what it was developed for!).

3) Nothing in the MiNT XFS interface prevents filesystem reentracy,
however I doubt that just removing TOSFS will make MiNT's
GEMDOS fully reentrant (which is one of the big advantages of
the MagiC kernel).

4) MagiC's VFAT implementation is solid, while MiNT 1.15.x's
version seems to have some small remaining problems. I currently
would not use it on a critical partition, and I sure hope that
Frank Naumann will resove the remaining issues. He sure came
up with a nice implementation in little time.

SPIN! (my CDROM XFS) can be downloaded from

http://www.muenster.de/~reschke/soft_e.html

I sure hope that we can restrict this discussion to a more technical
level from now on.

Regards, jr

5273. Odd modem2 problem (Falcon)

Newsgroup: comp.sys.atari.st
Date: 1998-12-27 00:00:00 UTC
From: Jan.De.Smedt@village.uunet.be
Message-ID: <765dagjrr1@nickel.uunet.be>
Source record: 87590

Hi,

I`ve got a Falcon 030 with Mighty Sonic accellerator and 16 MB RAM + 4 MB TT RAM.
I`ve also got a 3com PalmIII. Communication between them is handlded through
the Pilot Tools by Rodolphe Pineau, a freeware MiNT/Linux port.

http://www.chez.com/stratos/pilot.htm

For speed I use N_AES 2.1 #970302 which I bought on the Neuss Atari Messe.

Just a few days ago the PalmIII refuses to link with the Falcon.
It did OK for months.

I verified with Profile2 system analyser: de default com is now modem1,
it used to be modem2, as it should be. Even if I use SET_DEV7.PRG, wich is
supplied with Profile2 it still stays at modem1.

However, communication with my modem still is fine, faxing & internetting OK.

MODEM.CPX has the out port on modem1 and greyed out (disabled).

auto folder:
DRVIN .PRG 3.923 bytes 17.05.94 (HSmodem07)
SCC .PRG 8.756 bytes 08.06.96
MINTNP.PRG 191.097 butes 25.11.98 (FreeMiNT 030 1.15.1-0.3)
work fine

N_AES.CFG
..
export PILOTMODEL=PalmIII
export PILOTPORT=/dev/modem2
export PILOTRATE=38400
export PILOTBACKUPPATH=L:\PalmPilot\Backup
..

Could This be a hardware failure?
Can anybody help me please?
If anyone is interested in digging into this, please e-mail me and I will
attach a profile2 report and N_AES.CFG to the reply for analysis.
I havenï¿½t done it now so as not to slow internet down (aprox 85 kB).
Iï¿½ve sent a copy of this msg to Woller Systems & Rodolphe by e-mail.

Merry Xmas and a happy New Year!
Greetings,
Jan

Ronald, by now I'm taking any advise to just try it again.

Unfortunately, CTL-A doesn't apply magic here :-(

Nor did Martin's suggestion to put ramfs.xfs on the root. Nor did a complete move of "KEMD" to my C:\ and trying it from there. Nor did de-activating "cache" in the setup.

The suggestion to get a newer ramfs.xfs led to yet another problem: it says only compatible with Mint 1.12.6 and upwards. Too bad the Mint from the installation package is 1.12.4 :-((((

So, still going around in circles here! (Not to mention I'm running out of fuel too...)

Over the last couple of years, several people have tried creating
new Atari newsgroups (comp.sys.atari.networking, comp.os.mint,
comp.sys.atari.030 are names that pop into mind) but because the
procedure involved into creating new newsgroups allows _ANYONE_
to vote, it usually has resulted in Amiga/PC users voting against
and outnumbering Atari users..... So much for democracy.....

Is it really? AFAIR, HasbroInteractive owns everything Atari,
nowadays, including any TOS or ST/TT/Falcon assets.

I have sent emails both to JTS and Hasbro, to help clarify the
matter, but ..... no response from either ones yet....

Hi Louis. Hmm, like you-I'm no Mint "expert" but I would assume (there
is that word!) that it can't find files because the Ram disk is not as
big as its supposed to be/non-existent. Since it can't temporarily put
the files where they are expected to be, it gives an error message that
it can't find them...I'm guessing.

BTW, you don't have any Atari users local to you that could help out?
I know I've had that problem over the years, but the online Atari
community has saved me poor roasted bacon numerous times... ;-)

PS I can't imagine why it won't install on a stock TT.

On 28 Dec 1998 12:04:30 , Louis wrote:

You seem to be getting farther than I did. All my TT did was bomb
at any attempt to run the installer from the desktop. However the
installer is really the mint kernal just renamed so you can try this
trick below on your TT and see if this does it for you. This method
worked for me strange as it may seem. And yes I have it all setup
after doing this way back when and very happy with it.
Hope this helps.

Try this:
This is how I got the mint install to work on my TT.

first put all the mint install files on a TOS partition somewhere
do not place any files on the partition you plan to install as minix

format a fresh 1.4meg floppy disk
create an AUTO folder on it
copy your HD driver.sys from C: to the AUTO folder on A:
rename driver.sys to *.PRG so it will load
decompress the contents of instflpy.zoo to root of the floppy on A:
move kgmdinst.tos to the AUTO folder
rename kgmdinst.tos to MINTNP.PRG so it will load
cold boot the computer and bypass your normal C: bootup so A: boots instead

If all goes well your HD driver will load, then mint, then finally
the script to install mint will run.

I have recently seen embeded systems utilizing 60Mhz 060's.
That was their rating, not just the system speed.
There is this LAN card that uses dual 060's.....
But that is another story:).

>It's in the Quick FAQ!
>

Thanks everyone for your help. I did check the FAQ (that's how I found this newsgroup,) but it didn't provide the answer I am lokking for. My main problem is that I don't have an Atari anymore.

I tried ataridsk on my PC, but no luck. I'll give MagicMac a try.

Thanks again!

thbarr

5289. Newsie sig files

I use Newsie in off-line mode to read news and queue replies for posting. It appears that when I upload, the last .sig file selected is added to all posts waiting to be sent. Is there any way of selecting different sigs for individual posts, or possibly a different sig file for each newsgroup?

I get this a lot, too, but I thought it was a 'feature' of the demo
version I am using.

It would be nice to get rid of it.

Hi,

well, thanks to Katherine I got the stuff installed...
Had to put KGMDINST.TOS on a floppy, together with HDDRIVER.PRG, boot from
that one and finally the installation went like it should have in the
first place...

So now I've got this Minix partition working, although I haven't got it
running yet as it should be... Somehow I'm not getting to the console.

Well, I'm flying a waiting pattern again instead of just getting round in
circles and getting nowhere...

ACSI to ACSI is just a straight through 19-pin cable, you should be able to get
the plugs from Newark or Farnell.....ACSI to SCSI then you'll need a converter..

Lonny, if you call getting bombs is getting farther, well, OK...

Basically I got the same, except for the bombs.

After Kellis emailed me with what you descibed further on, I managed to
get it done...

At least the installation is done now, next probably are some more Q's,
but for the time being, I'm just glad this stuff sits on my Minix...

I agree completely with this. In fact, CSAST.tech could be incorporated here as well. Tech has very little input anyway and it gets cross posted so much that half of what's there is also here.

In addition to a bunch of STs and a TT, I have a lone 68040 Mac. If you think STs get lost in the TT, Falcon and clone messages here, try reading the Mac newsgroups and finding posts about a 68xxx machine. 98% of the Mac messages are for PowerMacs, not even the same family of processors.

Here, most everyone owns, or has owned a 68000 Atari. Even those who have moved up to the 68030 and later stuff can provide help to the 68000 users.

I would not like to see this newsgroup split up any further.

Personally I don`t see why, but try to move the Advertising Filter Module
out of the module folder. Don`t delete it, you might want it back later.

Without it, you download and fill up the cache with all kind of advertising
grafik. The advertising filter is one thing that all my PC and Mac friends
envy me.

cheers
a merry christmas and a happy new year

Hm, i think it's only a problem with the drivers you have.
Sorry, i doasn't know anything about your software, if your
modem work well the hardware must be ok

If you found in modem.cpx modem2 disabled, any other device
use that port. Fax software as .acc installed?

Standart zeromodem

Signal 9-pin 25-pin Description

RxD 2 --------- 3 Receive Data
TxD 3 --------- 2 Transmit Data

RTS 7 --------- 4 Request To Send
CTS 8 --------- 5 Clear To Send

DTR 4 --------- 20 Data Terminal Ready
DSR 6 --------- 6 Data Set Ready

DCD 1 --------- 8 Data Carrier Detect
RI 9 --------- 22 Ring Indicator
GND 5 --------- 7 Signal Ground

Other version of zeromodem:

RxD ------------------- TxD
TxD ------------------- RxD
DTR ------------------- DCD + DSR
DCD ------------------- DSR + DTR
RTS ------------------- CTS
CTS ------------------- RTS
RI -------------------- RI
GND ---+--------------- GND
|
`---(CableShild)

Only with 3 wires, but it is slow!

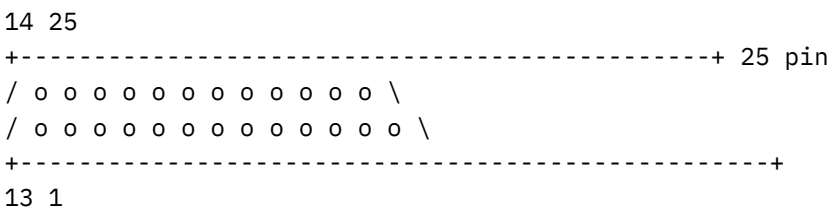
9pol 25pol

2 ------------------ 2
3 ------------------ 3
5 ------------------ 7

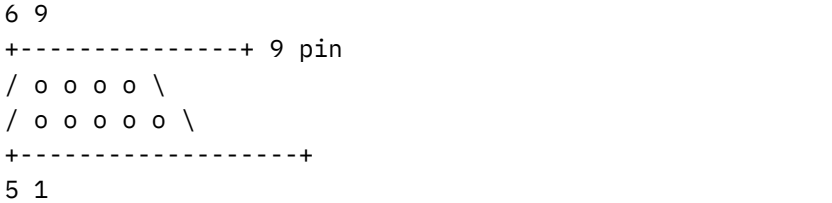
Add handshake for higher speed...:

```
7 ------------------ 5
8 ------------------ 4
```

Connectors:



1: GND (Protective/Shield)
2: TxD
3: RxD
4: RTS
5: CTS
6: DSR
7: GND (Signal)
8: DCD
20: DTR
22: RI



1: DCD
2: RxD
3: TxD
4: DTR
5: GND
6: DSR
7: RTS
8: CTS
9: RI

It's a part out doitf030 v6.3.0 (doit_ST), hope it works for you.
Use terminal sofware on both machines.
Otherway have a look for ghostlink, parcopy or some else..

Whenever I try to download a file from CAB using aFTP as my server,
it briefly shows the download dialog, then gives me the file
selector, asking me where to save it. I click OK in the file
selector and it then gives an alert telling me it "can't create local
file."

Any thoughts on what's causing this?

Source record: 87472

I was on a web site earlier ordering some DVDs. I used their mail order form. Unlike other web sites that have you fill out the form and then it creates a printable page, this site has you fill out the form and print THAT page, the idea being that your info is never sent across the Internet. Unfortunately, when printing that page with CAB, it prints out the blank form, without all the info I entered. Is there any way around that?

Also, using the DeskJet 550 Color driver for my DeskJet 672C, CAB prints in monochrome, even with monochrome deselected. Is there a fix for this? Perhaps a better driver for my printer?

Source record: 87535

Hi All,

I have just updated from CAB 2.5 to 2.7 (yes, the English version is now available from System Solutions) and I have started to get "Censored" boxes over some of the advertisements on various sites.

Does anyone know why ?

It is referred to in the Docs (where it mentions filtered banner advertising) and it says that the "censored" image can be changed if required, but does not say why it is there in the first place.

I know some of you may think I am a little crazy wanting to read the ads anyway, but I would sooner take that decision for myself than have the computer do it for me :-))

Cheers

Paul

Hi Paul:

Go into the advertising module under the FILE menu and
uncheck the "use filter" box, or set up the size and/or source you do
want filtered.

Where can I find the instructions for this modification? I looked in all
my Atari FAQ files but found no reference to adding ST ram.

Your best bet would be to save the Cubase songs as .MID files on a PC formatted floppy disk, which can be read by your Atari. If you have PC Exchange for the Mac, it will be able to read the PC formatted floppies as well. Another possibility if you are you using Cubase on the Mac: I >believe<? that Cubase song files (.SNG) are cross-platform compatible (but you still need to store them on PC formatted disks). Hope this helps!

5314. Re: Freemint set up

From: louis@holleman.demon.nl
Message-ID: <368765c6555fd0@holleman.demon.nl>
Source record: 87542

Hi, and this one is for the EXPERTS:

I think I got one tiny step further as to why the whole KGMD package at least sucks on my system:

It must be very clear by now that on my TT, running TOS 3.06, it won't install at all. No way. Period. Read the previous messages.

So, I hooked up my tower (drives Quantum-2 and the Syquest, which is intended to act as Minix drive for the time being) to my 1 Mb ST, running TOS 1.04.

Starting the same KGMDINST.TOS in the KEMD dir results into the following lines after the (once only blinking) cursor:

```
Minix file system driver for Mint. Version 0.60
Copyright 1991 1992 1993 1994 1995 S.N. Henson
Patch level 11
Please read the file COPYING for conditions of use
This is a modified binary version for KGMD
See /user/src/minixfs for details

TURBO mode

Ramdisk filesystem for Mint (Version 1.5, compiled Jul 20 1994) by T.
Bousch

Entpacke RAM-disk. Bitte warten...
: can't exec gzip: out of memory
: child returned status 4
: not found in archive

Fertig

Kopiere tar und gzip auf dir RAM-disk...
pid 0 (Mint): u:\bin\install: file not found
pid 0 (Mint): u:\bin\install: file not found
pid 0 (Mint): u:\bin\install: file not found

FATAL: couldn't run \bin\sh
exit code: -33
```

And that gets me back to the desktop.

Basically I read the following from these lines (but, I'm no expert)

1. The ST has not enough memory to carry out the installation
2. Some files are not where they are supposed to be?

I think I explained enough before where my files are: in I:\KEMD\ and
that's exactly what the docs told me (apart from the drive itself).
Furthermore, there IS an empty dir MULTITOS on the same drive, as
suggested. No mintnp.prg or whatever in the AUTO dir on this drive.

The G:\ drive is e-m-p-t-y, 44 Megs, no dirs, just EMPTY!

Thusfar the "installation" didn't ask which drive to use for Minix, but I
gather that normally would come later.

OTOH, I don't get the lines "u:\bin\install: file not found" then...
but again, I'm no expert.

And of course, the main question: why the bloody hell won't the install
TOS run from my TT???????????????

BTW: in the meantime I have been running my TT from both HDD 7.02 and
Hushi, but you understand it made no difference (well, you'd try ANYTHING
if you got where I got...) And I don't know how to boot cleaner than I do
rite now: booting, hit the CTL key and that's it. ST-Low rez (eventually
going to ST-Hi or TT-med), no ACC's, no nothing from AUTO. Cache on or
off, no difference.

So c'mon EXPERTS, what's going on here?

V32 is not a terminal standard, but a modem speed protocol. VT52 is a
terminal emulation standard.

Just get ghostlink or ParCP from any Atari FTP site.

---rants about ST emulators and TOS clones taking too much place---

Yes, it's true. Emulators have taken a _big_ share of this newsgroup. Back a couple of years, on IRC #atari, people would call names to any of the rgulars who would move to a PC. Then, a regular's Falcon blew up and he got himself a Linux box "in the meantime and until". Then, more people got themselves one, mainly because being fluent on Win95 stuff has become a requisite on most computer gigs, these days. When another one took his Microsoft certification, some people yelled, but I personally understood the nature of the business. Result is that, like it or not, PC hardware is more happening and people need it to get work. If they happen to have one on their desk, they try to find a way to run favorite softwares. Enter Emulators...

> The ST newsgroup has Milan, TT, and Falcon information.

Well, people _have_ tried creating newsgroups for the more recent machines, but it's nearly impossible... at least in the "comp.sys" hierarchy. I suppose it might be easier in the "alt" hierarchy, but then it's also a matter of pride: people _don't_ wanna _have_ to be pusehd into "alt" when every other platfrom has proper news groups in "comp.sys", so we end up having a mixture of TOS stuff.

> I'm looking for information on what I can still do with my STs,

You can still do _a LOT_ but, remain aware of the limitations. ST-High and 4 MB _is_ limited. However, you can still do a lot within just that. CAB 1.5 and STinG allow you to browse on that, MiNT gives you Unix capabilites if you want to(o), or you can also use it as a clever Terminal with built-in mouse support, at least.

Nick Bales Quick FAQ certainly exists precisely _because_ many people like you re-enter the scene and need to learn what's been going on since they left. http://quickfaq.atari.org/ Use it! ;-)

have you checked with System Solutions? They were advertising in the last Atari Computing that they are an official dealer and have complete systems as well as motherboards for sale (I think I'm going to take the latter route on this, as I think the fun factor alone in getting all the parts together and "rolling my own" is going to be worth it :)

>
>2) I want SCSI! This is more than a possible snobbish desire to avoid
>IDE. I would like to be able to use my existing SCSI devices from the
>TT and Falcon (not only drives but also CDROM's, tape drive, scanner).

that's a major factor for me as well, especially with my Syquest and my scanner. I did go to the Milan site a few weeks ago (http://www.milan-computer.de/html_gb/index2.html) and while my German is rusty :), I do believe they announced the availability of the SCSI card. You might want to check the above link.

this is one question I have - has anyone tried the Hades version of MagiC on a Milan to see if they can get it running?

In any case, if the Milan truly has been selling as well as I've been hearing reports on (though I'd like to hear an official one), you'll be sure ASH will want a part of that market....

Hi Louis! Glad to hear that you finally got Mint setup. Kellis (and multiple others) helped me immensely as well.

Now...Peter R. has publicly stated several times that he will not support a buggy OS like AES 4.10. I never could get STing to work with it (notice how I'm differentiating from Mint!). STing works fine with the Mint kernel in the Auto folder, its AES 4.10 that it doesn't work with. (note that STing will work with the first MultiTos release from Atari-just not the developers version). Get N.aes, you won't regret it.

Not sure about Mint newsgroups, but there is an IRC, #mintos. There is also a Mint mailing list, which is very helpful. Its:

mint@atari.archive.umich.edu

You have to subscribe to it, but I've forgotten the exact details. Can someone else give him the correct steps? Thanks. Hope this helps. ;-)

which version of NVDI are you using? When I was using CAB with NVDI
3, I had the exact same problem you were describing - when I got
version 4, the problem went away.

BTW, version 5 has a number of new dedicated drivers, including one
especially for the DeskJet 540 - what a difference that made. I believe
they also have 660 drivers as well that'll work with the 672....

Actualy, nowadays, the list is hosted at mint@fishpool.com but
any posts to the old address will be forwarded. Avoid cross-
posting to both addresses, please! ;-)

To subscribe, email majordomo@fishpool.com with "subscribe mint"
(without the quotes) _IN THE MESSAGE'S BODY_.

This new list will soon have its homepage on http://mint.atari.org
Stay tuned.

Actually, it _was_ something that I mentioned in one of my messages. Along the lines of the Atari 8-bits having a newsgroup that didn't have non-8-bit Atari info in it, I was kind of expecting the ST newsgroup to have significantly less non-ST info in it.

It's become clear that I'm a minority on this, and further, it seems that in trying to make my point, I've come across as a ranter or troll. Neither of which was my intention, and I apologize for coming across that way (This is more a response to the entire thread and some personal email I've gotten, rather than a direct response to Tony).

I still feel that it's a shame there's so much non-ST stuff in the ST newsgroup. But I guess that's my problem.

I'll just go away now.

Jeff

We are working on an 68060 upgrade - it should be available somewhere around
january (we showed a prototype Milan with 68060 on the last atari show in
Neuss).

>2) I want SCSI! This is more than a possible snobbish desire to avoid

Magic is being worked on, but this might still take some time - the hardware
is a bit different.

>
> John Logan

No, Amiga 060 upgrade boards have been available for some time (including
060/PPC boards) which are 60Mhz processor boards. I believe that a 66Mhz
060 is also available. Whether the 060 is a clock doubled version, or full
speed rated version doesn't make a great deal of difference in processing
(number crunching) performance as the processor itself still runs at 60 Mhz
internally.
The only real difference is in the processor/system bus performance with a
clock doubled processor, which will run at half the processor speed.
Some system busses simply cannot handle the higher speeds for many possible
reasons. The Amiga 060 processors are not clock doubled and run at full 60
(66?) Mhz bus/processor speeds so I imagine the same can be applied to
Atari systems.

Just my 2c,

Regards,

Clockmeister.

|problem was remains unclear.

I'm sorry to have to come back to you all on this one but shortly after posting the above I started to have problems again. They have been sorted out but I thought someone else might benefit from my experience.

There have two areas of difficulty. The first is odd behaviour of the pre-scan window and this is the reason I am re-posting. There seems to be a definite problem with STiK and Look2 in that when STiK is loaded, Look2 mostly does not work properly. It occasionally does but mostly does not.

But, and this is the odd thing, the problem goes when ST Guide accessory is also loaded. Why I don't know, but it works.

The other problem of stripes in the scan area is not seen with a German Look2 (version 1).

There's loads of good demos around, and lots of sites to find them.

Start at:

http://wombat.ludvika.se/dhs/

The site has lots of downloadable demos, and lots of links to other
demo crew sites.

Two good ones to look out for are Sonoluminesenz and the Lost Blubb
demos, although they are not necessarily found on this site.

Cheers!

I don't have the 660 driver. The highest number I have is 550. I
take it that 660 came with NVDI v5?

I guess I could try the 500 color driver and see if that works...

>
Currently, sigs are added when the article/email is actually sent to
the server. This means that if you want a sig on one, but not
another, you must connect and send that single one.

This was done to reduce the amount of disk space required to store the
sig on each and every outbound mail/article.

As for a different sig for each newsgroup, that is something nobody
else has asked for, and would require additional parameters to be
attached to each newsgroup, probably via another edit dialog, and
another file, etc.

5345. * [ANN]: Login v0.12 Beta

Newsgroup: comp.sys.atari.st
Date: 1998-12-29 00:00:00 UTC
From: quantum@voicenet.com
Message-ID: <bmbi2.1081$7P2.10044482@news2.voicenet.com>
Source record: 87423

Login has just been updated to Version 0.12 Beta. Just to
recap, Login allows Atari computer users to change user configurations
in a password protected environment just like Windows does. Very
useful for people who have more than one person use their comptuer
(and those people want to shuffle colors, icons, Auto files, Cpx's, or
Accessories around), or for those (like me) who are tired of changing
settings just for one program that may not like a particular auto file
or desk accessory.

With 'Login', you can create up to 25 different users (each
password protected, but they don't have to be) which upon logging in
'Login' will change NEWDESK.INF, CONTROL.INF, plus Auto files (but
does not change the order), Desk Accessories, and CPX files. Login is
totally freeware, and always will be.

***** Login can be downloaded from:
http://www.voicenet.com/~quantum/login.zip

Here's a snippet from the History file to showcase changes:

======
History

December 20, 1998: Version 0.1 Beta released.
o First beta release.

December 24, 1998: Version 0.11 Beta
o LOGIN.PRG will no longer be changed upon login. Could have
caused a problem if you manually changed your own config file and
forgot to include it (like I did during testing).

December 26, 1998: Version 0.12 Beta
o Erased the CONTROL.INF and NEWDESK.INF files before rewriting them
from individual users files. Might take care of some anomalous
problems.

Ronald, it IS the intention, but my bank account must grow fatter first.
So I'm stuck to AES 4.10 for the moment. Well, I've got two more OS-es to
run from, MagiC and TOS, which will do for the moment.

I just put a mail out to majordomo@fishpool.com

Also subscribed to muc.lists.mint and maus.os.minix, but the second one
seems a dead one.

BTW, is it correct you need the compiler to be able to run MiNT? What I
mean is get access to the system, consoles etc. Right now I'm just unable
or I missed something... :-) I only installed Basic, Net and Manual. And
the Syquest's just a bit too small for X11 added also...

James F. Haslam (jfhaslam@zetnet.co.uk) wrote:
: Can you give us a quick rundown of what the program is intended to do
: and what its like?

Sure! Long story short, it allows Atari computers to have
different user configurations in a password protected environment similar
to Windows. Each user can have different NEWDESK.INF, CONTROL.INF, Auto
files, CPX files, and Desk Accessory files. Useful for people who have
others access their computer because each can set it up exactly how they
like, and also useful for those who are tired of switching Desktop acc's
or Auto files, etc just to run one particular program which may not like
it.

It's totally freeware and always will be. It is still very beta,
and I plan MANY changes to it. I wrote it because I got tired of
rebooting with hitting 'Control' just to run a few programs that don't
like some of my Auto files. Now, I can create a new configuration that
that program will like and just login as that "user". Also, sometimes my
roomate uses my ATari, and he hates the way I have things set up. Now he
can set it up however the heck he wants and I don't have to worry about
it :) I figured I can't possibly be the only person with these problems,
so I'd put the program out on the 'Net for use by others.

Login can be accessed from http://www.voicenet.com/~quantum/login.zip

Hope you enjoy!
George

I have an Atari Portfolio for sale. Includes Parallel port (for connecting to a desktop PC, which actually still works under Windows 95/98) and an additional 32k memory card. Own a piece of history; this was the first PalmHeld PC, and it was released in 1989!

Make offer...must go soon!

Surely this will only apply if you stay on line and send each mail
separately. When sending a queued postings batch then the last .sig
chosen will apply to that batch.

I've just checked my latest download, and out of 64 articles, only 20 are not directly applicable to ST users. The rest are potentially of interest, I would say, being largely the Milan thread.

In your other message you ask what you can do with an ST: largely the same as you can with any other TOS machine. Discussions here regularly cover MagiC, MiNT, utilities, DTP, word/document processing, web access and client software, music, software availability on the net etc etc. ALL of which are ST-relevant. It's inevitable that a lot of those people who still actively use the platform will have migrated to higher-powered hardware or emulators, but nearly everything discussed here can be done on an ST, though with limitations.

Unlike the 8-bit machines, the ST/TT/Falcon/whatever platform is still active, rather than just being a retro computing interest (*dons flameproof suit just in case*). People therefore discuss things that are currently relevant, including the way to move forward with the platform: hence the recent discussion about emulators versus native hardware. A symptom of the ST not yet being a museum piece, and therefore a good thing IMHO.

<snip>

MPC comes with an English manual, though the bulk of it is just the same as
the normal MagiC manual. Unless you are using particular hardware I would
have thought that if it works under Atari MagiC it should be OK under MPC.
Apologies if you are referring to the general lack of MagiC programming
docs in English.

J > with how the Calamus "upgrade path" is get a PC and MagiC,
J > just to name a few threads I've ignored lately.

The reason that there are few ST-only threads is pretty simple.
You forgot to ask a question or several questions. Or some other
ST-only user forgot to ask his question(s). When those questions are
asked, when those interests are expressed, I and many other former
and current ST users do our best to answer or respond. I attempt to
respond respectfully to the user and to the computer that we all
know and love - the grandfather of them all.

(short story mode on)
A couple of years ago, a sometime member of our user group
complained that, since he was an 8bit Atari user, there was very
little at our meetings and in our club _for him_. Our presentations,
demos, etc are and have always been put on by members. There was
nothing to keep him or other 8bitters from presenting _anything at
all_ at our meetings. It simply turned out that the _active members_
were ST-and-above-users. The 8bitters were fairly quiet. I think I
have made my point...
(short story mode off)

So if there aren't ST-only threads in this newsgroup... _start some!_
I will enjoy it. For one thing, it makes humble, dumb ol' me look
like an expert :) Besides that, I am certain to learn something
about this antiquated box sitting next to me on my desk (yes, I am
still an ST user).

P > wrong.. but unfortunatly true :((

If it is true, it is certainly wrong. I question, though, whether you are being flamed. No, no, no, please don't send your archive of flames to me - I don't want them. But there is a difference between "I wish you had written it to run on _my_ machine, too" and "You bleeping moron! What kind of an idiot would write for that old, antiquated, blah, blah...." The former, I submit, is not being 'flamed to hell and back'. The two sorts of comment should not be lumped together and labeled flames.

However, I do reiterate - it is wrong to flame someone for using, or writing for, only the ST, on this newsgroup. Or anywhere else, for that matter. IMHO.

Or MagiC in general, which runs on an ST, or MiNT, or Cubase, or STiNG...
Many people ask for help with their Ataris.

I ask you again, what are the exact topics you would like to discuss ? Why
not start a discussion instead of criticizing the threads that are already
being discussed ?

>And by the way, I didn't even start this thread. I merely agreed with the
guy who
>came to this newsgroup, naively expecting ST information in an ST
newsgroup.
>

This is where you are wrong. The c.s.a.st newsgroups is for discussion
related to Atari's 16/32 bit range of computers. This includes Falcons/TTs
and by extension, TOS clones, and yes, STs too.

It just seems to me that nowadays, the active Atari users are mostly 030
owners, so the discussion on this group reflects that. This doesn't mean
that ST discussion is not welcome. of course not.

>> When you say this newsgroup is of no use to ST-users it makes me wonder

information
>there is minimal and buried.

You're wrong. There's a newsgroup for Atari ST/STE/Falcon/TT computers. You
seem to ignore that most of these machines are very like each other. The
main difference is speed and memory size, so you'll find that most of the
Falcon/TT talk will also pertain to your ST.

Now, if you have any ST-only issues you'd like to discuss, then go ahead. As
someone else said, most people here have had or still an ST, and people here
are generally very helpful, regardless of the machine.

A not disimilar idea ocurred to me also, but for the PC. I never gave
it that much thought however. On the other hand the subject did crop
up the other day in an email conversation.

The main problem would be the availablity of source code for most all
the major apps which are currently used.

>I personally dislike CPU-emulators intensely, the day I'll have to use
>a emulator to run GEM-apps is the day I stop using GEM-apps
>altogether... I have tested some emulators (GEMulator, MagiC-PC demo)
>on my 374MHz CeleronA running NT, it's a rather slow and nasty system
>which constantly blows up in my face. That's why I still use my Falcon
>when I have to get things done.

I found the MagiC-PC demo to be (graphics aside, nvdi-pc would no
doubt boost this) reasonably quick. Roughly 10 times or so with 64Mb
on a 233MHz also running NT. Incidentally and off topic, if you
haven't already done so, move your pagefile onto a different partition
where it won't fragment.

Three things about MagiC-PC ...

1)
It's too damn expensive.

2)
Drag an atari folder to the trash and it & subfolders sometimes won't
delete (NT sharing violation).

3)
No english docs. This has killed off my enjoyment programming the
Atari.

Anybody the vaguest idea how much of a problem locating sources to recompile would be?

If an author has left the scene they probably won't mind making sources available. Trouble is, if *I* were still developing an application and didn't have a PC/Mac/whatever myself I'm not sure I'd want to let a third party loose with my code.

In summary I think the idea is a good one and well worth persuing. If successful it could even result in a widening of the atari user base.

Hi Martin-Eric,

AFAIK this is different in the alt.* hierarchy - voting isn't the
issue there, you just have to convince individual ISP's news admins to
take (or not delete) the newsgroup once it's newgrouped.

Personally things seem OK the way they are, but then again, maybe this
community _is_ becoming a bit 'alt'ernative <G>?

Hi Joergen, Lonny, ...

I already used $HOME before, but I installed a clean MagiC 6 setup,
and it _does_ put this into MAGX.INF (for the sake of COPS), as
C:\GEMSYS\HOME\

Also with MagiC 6, modules like MGCOPY, etc. & VT52 will save their
*.INFs there if it's set (unlike MagiC 4 - don't know about 5, never
had that). Worth knowing just in case you can't find them :-}

Hi Peter, Katherine,

This has been integrated into MagiC 6 (and v5.xx IIRC), so
XMEN_MGR.PRG is no longer needed.

I totally disagree! Most of the stuff talked about here concerns the old ST
as well as newer TOS-computers. I think it is amazing that most of the new
software released in the atari-world these days is *still* compatible with
the old ST.

Since we need progress even in the atari-world I don't think we can demand
ST-compatibility for every new program, but since I myself use an old 4Mb STe
I definitely consider it as a bonus!

When you say this newsgroup is of no use to ST-users it makes me wonder if
you follow this group regularly? As I mentioned, I have only got an STe
myself, but this group has been very valuable to me.

Of no use to ST-users? I'm glad to tell you how wrong you are! :)

Regards,

Joakim

5371. Re: Freemint set up

Newsgroup: comp.sys.atari.st
Date: 1998-12-29 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <36885cd897f440@holleman.demon.nl>
Source record: 87483

Hi,

Finally, at last, big thanks to Kellis, I got it done.

Putting hddriver.prg first in "auto" on a floppy, kgmdinst.tos renamed to mintnp.prg and put second in the auto. Other files of instflpy.zoo to the root and the installation started up and continued up till the end.

Done most things as described in the docs and now the next Q:
how do I get back to the console(s)???

Booting Mint will get me to AES4.10 and to its desktop. This was straight after leaving the "terminal or console screen" at the end of the installation, after moving "mintkgmd.prg" to c:\auto and copying several files to c:\multitos.

I did specify passwords, username, etc during the installation, but now every Mintboot gets me the Gem.sys starting up and next Thing being loaded.

Another strange thing: this KGMDINST.TOS only worked by renaming it to MINTNP.PRG. The mint030.prg that came from it to \boot was copied to c\auto renaming it to mintkgmd.prg, as suggested.

Now when I boot, it starts up and hangs (again) at the last line "use at own risk". I've just renamed it to mintnp.prg and now it boots fine....

So the next questions are:

1. How to get to the console(s) again?
2. How to install further stuff (like X11) to the Minix drive?

I got the impression that the problems I encountered, are TT-specific. Lonny had the same problem and I just got a few emails from David Leaver who had also problems on his TT. Perhaps this should be added to the installation docs plus the method to get it done?

Anyway, thanks a lot to all who have helped or tried to help!

5372. FS: SyQuest EZ-Flyer 230MB SCSI external removable hard drive

Newsgroup: comp.sys.atari.st
Date: 1998-12-29 00:00:00 UTC
From: trevor@cyberspc.mb.ca
Message-ID: <dv_h2.3654$EG3.2646@typhoon.mbnet.mb.ca>
Source record: 87484

Perfect for a Falcon or TT with a SCSI port or any other ST with an
ICD Link or other host adapter.

This is the great little 3.5" SyQuest disk system that holds 230MB
per cartridge. It can read and write the older 135MB cartridges also!
It is in a rugged and cool-looking external portable case. It is a quick
and cheap way to add a hard disk or unlimited removable storage to any
system.

It comes with the A/C adapter, SCSI cable (depending on what kind you
require, email for info), one 230MB cartridge disk and the drive itself.
Everything is in perfect working order and there are no bad sectors on
the cartridge. It is guarenteed to work for 2 weeks after receipt.

Only $129 including free shipping anywhere in cont USA and Canada!

Also forsale, spare cartridges for the 88 MB SyQuest drive:
Carts only $34/each or 5 for $139
All of them are geniune SyQuest brand.
NO bad sectors
(except 1 cart might have had 1 or 2 if I remember correctly)

Guarenteed to work as expected.

--
E-Mail: trevor@cyberspc.mb.ca

All prices in US$. Prices do not include shipping unless otherwise stated.
Will ship anywhere in the world. Terms are usually payment up front. Items
are always shipped within 24 hours of receipt of payment. Hundreds of trade
references are available upon request. I've been buying and selling on the
net since 1992!

Check out my other forsale lists at http://www.mb.imag.net/~trevor/forsale.html

I disagree totally. How many ST users come on here and get answers to their questions. You'll hardly ever see any question go unanswered. This is one of the strengths of this newsgroup compared to other ones.

What are the issues which are relevant to ST users, but not to Falcon/TT/clone users? Games maybe? Discussion about games is welcome in here, however it just doesn't seem to interest that many people anyway. I doubt you would get a higher volume of ST-only discussion by splitting the newsgroup.

The only program I know of is ST2DOS, which is in the FAQ, but will only
convert the bootsector. If the disks are of the old single sided 360K type,
then you will only be able to convert them with a real Atari. This is
because many modern PCs can no longer read single sided disks.

>I tried ataridsk on my PC, but no luck. I'll give MagicMac a try.

Try sending them to an Atari user near you who'll be able to convert them
for you.

Sadly, the Phenix has been vapourware for several years, although now there are tangible prototype boards comming out quite regularly. I still wouldn't imagine seeing it finished before the end of 1999 or beginning 2000.

Dolmen is supposed to be a whole new TOS compatible OS, not just a patched TOS.

Besides, the Milan 060 is supposed to be coming out soon. Milan has said that the 060 milan will be an 040 with an expansion board, and the pricing scheme will be figured out so that buying an 040 now and upgrading to an 060 will cost the same as buying an 060 straight away. I'm not sure about the clock speed though.

Hello All:

Lately I have been interested in Hypertext "Books" or liturature that you can read "on-line"using St-guide. I found the Tarzan and John Carter books and Alice in wonderland at www.nic.funit.fi/pub/atari However I was wondering if there were other sites with this type of Hypertext. How about "Edgar Allen Poe" or other "classics"?

I did find a wonderfull Bible program for the Atari with greek texts included and word searches (spiritware in washington state...free off the net!)

Anybody explore this realm in Ataridom?

> as well as newer TOS-computers.

I simply don't believe this is true. Most of the messages are concerned with MagiC on PCs and Macs, with adding memory or graphics cards to Falcons and TTs, with specs for the Milan, with how the Calamus "upgrade path" is get a PC and MagiC, just to name a few threads I've ignored lately.

> Since we need progress even in the atari-world I don't think we can demand
> ST-compatibility for every new program, but since I myself use an old 4Mb STe
> I definitely consider it as a bonus!

I never said anything about wanting ST compatibility for all new programs. I said I was looking for information on STs. The newsgroups for other orphan computers has information on those computers. The ST newsgroup, to a large extent, doesn't.

And by the way, I didn't even start this thread. I merely agreed with the guy who came to this newsgroup, naively expecting ST information in an ST newsgroup.

> When you say this newsgroup is of no use to ST-users it makes me wonder if
> you follow this group regularly?

If I don't see things your way, your assumption is that I don't know what I'm talking about?

About eight months ago I finally got the space to unpack and set up all my old computers: a dozen or so Atari 8-bits, a couple C-64s, and four STs (520STfm(2.5meg), 2 1040STf, MEGA ST2). About seven months ago I started looking around on the Internet for information about what folks were still doing with these machines. I've looked at at least the subject of every message here in that time. The Atari 8-bit newsgroups have Atari 8-bit information. The C-64 newsgroups have C-64 information. The ST newsgroup has Milan, TT, and Falcon information.

I reiterate that the newer TOS machines look great, and I look forward to owning some at some point: this is not an issue where I'm bashing people who use different machines. The problem is that there's a newgroup for STs, and actual ST information there is minimal and buried.

> As I mentioned, I have only got an STe
> myself, but this group has been very valuable to me.

Glad to hear it. Care to elaborate on how it has helped you so much?

> Of no use to ST-users? Iï¿½m glad to tell you how wrong you are! :)

Please do. So far, you haven't said anything that addresses my point. You've said I was wrong, and you've implied that I must not have actually read the group before shooting off my mouth. But what you've posted really just amounts to cheerleading.

All I'm looking for is some information on what I can still do with my STs, because they're great machines. I've had wonderful luck reviving my 8-bit Ataris with newsgroup info, and my tone in this post stems from my frustration that the ST newsgroup is so filled with non-ST postings that it is of little to no use for someone wanting to revive an ST. I'd be very pleased for you to prove me wrong.

I just doubt that'll happen, is all.

Jeff

5379. Finetuning MiNT

Newsgroup: comp.sys.atari.st
Date: 1998-12-29 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <368899683a1bd0@holleman.demon.nl>
Source record: 87491

Hi,

well the previous thread must have caused everyone to get fed up with it, so I'd figured I'd better start a new one... :-)

Now MiNT finally IS running (albeit not as the main OS, that one remains MagiC for the time being), I do experience things others don't experience.

Several people told me Sting runs fine with Mint... well, not here.

Although, Sting itself runs fine, but the clients don't.

I'm on Mint 1.12.4 now (and have been on 1.15.1-02), together with AES 4.10.

Starting Sting = no problem (as long as I don't run the login batch; if that one runs it's a big crash).

Trying to ping my ISP looks like 100%, no problems encountered.

Next I start Newswatch, and as soon as I hit the "retrieve" button it's BANG/stuck/crashed.
With Mint 1.12.4 I get this on my screen:
pid 18 NWATCH BUS ERROR User PC=5BC1A (basepage=155EF70 text=155F070 data=156A09C bss=156A6D2)

BTW, Sting loads AFTER Mintnp.prg (and displays it's loading the modules).

Perhaps any difference in setting up Sting on Mint vs. MagiC?

Some other question: are there any NG's on Mint? I've got this maus.computer.atari.mint_mtos hooked up, also the maus.sys.atari.mint but this one seems to be not active at all.

Furthermore I found muc.lists.mint, comp.os.minix, fj.os.minix and maus.os.minix in my list, but haven't tried any of these. Could be they're not active as well.

>Wouldn't HTML have more options and be more compatible.?

For cross platform use, definitely. However, for me personally I find ST-GUIDE and HYP files much more followable/readable for help files and straight ASCII text things. I find many HTML format files to be too flashy and graphic intensive when all you want is easy to follow help/instructions. However, HTML is good for magazine type things.

If we all learnt UDO language, we could then compile our masterpieces into both ST-GUIDE and HTML formats!

:-)

Kind regards

Ronald,

YES! That's exactly what I mean/meant.

To tell you the truth: this whole stuff is really amazing/stunning me!

Let's stick to what happened:

- carried out the installation of KGMD
- installed all the files there were
- got Gem.sys and stuff from the Tools archive and stuffed those into the Multitos folder. Now I am talking about the stuff on my C drive, so C:\AUTO and C:\MULTITOS, before we loose track. It means Mintnp sits in C:\AUTO and the rest in C:\MULTITOS.

At the end you get to a "console", being in Unix mode so to speak and I did what the manual told me. Next I reboot and get to Multitos. Never got to Mint (Unix mode). No matter how I editted MINT.CFG (I gather the last line should be INIT=c:\multitos\init.prg to get to the Unix stuff, or INIT=c:\multitos\gem.sys to get to Multitos). Well, it made/makes no difference here. Can't even get to XaAES when I tell Mint.cnf so.

OK, I'm stubborn too... :-)

This afternoon I got N.AES... (not an illegal one, it was bought at Neuss last time and I got it to evaluate/test it for a dutch ST magazine. After the test I'll return it to the editor and meanwhile I'm gonna buy it myself).

Guess what: after editing Mint.cnf to start up N.AES it stubbornly kicked me into Multitos, whatever I tried. And when I just removed Gem.sys from the Multitos folder it started complaining and booted the Gem desktop...

So I was just scratching my head up here.

Until I decided to start up one more testsite on my F:\ drive, putting only Mintnp in the Auto, creating a fresh Multitos dir on this drive with a decent Mint.cnf (fetched the one from the \boot\multitos on the Minix, reconfigured it for the correct drive and did a reboot: I ended up in Unix, after lots of messages on the screen. So now I can work Unix, but NOT from the C:\ drive (who please?????). And no, that's not because of the card, I can easily kick out the card initialize by means of Xboot and thus work ST-Hi or TT-med.

After that (and I spent some time in it, setting files OK, getting pppd working on the console) I changed the Mint.cnf to not init init.prg but N.AES (which was sitting installed on C:\ already. Well, you won't be surprised by now that I got N.AES on my screen!
After that I tried it from the C:\ drive again by editting Mint.cnf once more to run from C, but I get to Multitos and Multitos only.

Pardon me, didn't hear you? You said "this ain't possible?" Well, you're cordially invited to come over and see/check/try for yourself.

So, I already had a bunch of configs, I simply added a few more:
- on C I can start MagiC and Mint-on-Multitos on the card, driven by NVDI
- on D I can start Mint on XaAES on the card, driven my Matrix drivers
- on E I usually start MagiC or TOS in TT-med mode, with NVDI running
- on F (since today) I can start Mint--->Unix or Mint/NAES in TT-med

Now I gotta set this C:\ starter again to get at least N.AES running on the card... It MUST be possible!
I may get it done before 1999... who knows?

Happy New Year!

Hi Katherine,

no it is not broken in the Mint.cfg, I meant it GOT broken when I
transfered it into QED for editing the message. Strangely enough, now that
I got to the consoles pico DOES work. I tried VI once more after I had
read docs about it, where these stated that CTL-Z CTL-Z was for write and
quit.
So I tried it again, editted a file and hit CTL-Z and next came a line
"CTL-Z not supported in sh shell..." Well, I got pico.

I put in all the lines without the # marker. Did you see any GEM=something?
Not me. It's not there. Tell that to whatever "thing" which starts up
Multitos anyhow... :-)

I'm gonna build up a MULTITOS on C again from zero, starting with the
files from the F partition, where it does work correct. Will see what
happens.

Happy New Year!

A post from the unseen type 3 (advanced stage)

Christmas 1991 was when my parents bought me my first and
still my only 1040 Atari STe , it was a close run thing between the
familly cirriculum pack and the cartoon classics pack from the Ameoba.
(I know that were not supposed to get childish about it but I used
to love winding Amiga owners up at school!)

Using "parents logic" it was that the fact that the ST had
slightly more educational Software titles than the Amiga that meant
an ST is what I got. And I knew the second that that green screen

popped onto my TV that it was the right choice!

From playing Rick Dangerous for the first time , reading my first
issue of ST Format , playing classics like midwinter , then
civilisation , then Frontier , and then Obsession and Substation
to staying up to 3am finishing my Geograpy coursework (where at
one stage I thought I had 3 ST's) the ST has been there.
Programming , raytracing , finances , Databases , drawing , printing
DTP'ing <for want of a better word> , wordprocessing , gaming ,etc....
I've done it all with my ST.
Through the late teenage years with there various diversions
sure, the ST was a little neglected but a few months a go I #
decided to rectify the situation. I phoned around using the
contacts section of the last ST Format and was amazed to hear
that the ST scene was very much alive , and best of all on the Web.

So I set to it ,

A modem £10 , 4mb upgrade £3! ,

Megafile 20 + MagiC 2.01,Ease,Sting,CAB,Newsie + bits £30

+ freeserve internet connection (courtesy of Roy Goring)

And for less than a good night on the town I was multitasking
surfing the net , downloading software , sending emails and
reading newsgruops.

for me < althrough I am easily pleased > this is what computing
is all about.

The Falcon ,Hades , Milan they've all got the esscence of the ST
in mind and therefore they are rightfully in this NG.
But to know your direction is to know where you have been and if they
match the ST for what it was in its time then they can't go far wrong.

I sorry that I've bored you , but suffice it to say that my STe is
all that I've ever needed and who knows it may be well into the
next century before that changes.

The Web never looked so good on a TV.

A spotty teenager

Sent using the power but without the price to boot.

Actually, I believe you can download Atari ports of PGP v2.6.3i and v5.0i
from The International PGP Home Page (http://www.pgpi.com/). I haven't tried
them myself, using a PC nowadays, but I thought you might be interested.

There's also a shareware encryption program call MBE available from
CyberStrider (http://www.cyberstrider.org/computing/atari/support.html).
Again, I haven't used this myself.

Wrong, I've it running on my Hades using freeMiNT 1.15.1-0.5-N.AES 1.2.0.
Initialy I couldn't use it but recently I managed to get it working. What
was the problem? I really don't know. I only used a new archive which I
have found on a CD. The one I retrieved from the Net didn't work.

With NVDI 5 combined with MagiC 6, printing all happens in the
background! :)

Its great! I can now visit a webpage, set the print process going,
surf to another site and print that too, and so on...

Definately worth an upgrade! :)

Cheers!

BANG!

Got it!!!

One sneaky, sleazy, tiny little Mint.cnf put on the root of C by the
installation of KGMD. I only checked the root BEFORE...

This little monster gave me headaches :-)

No wonder why I was kicked into Multitos everytime...

Next is figuring out the configuration of N.AES... no, I'm not finished
here!

I use Everest as an editor, which can probably do that too.
But what I really want is a program that I can just drag the file to, and it
does it automatically, without having to load it into and editor etc. etc.

There is a german ST-Guide hypertext called MINT.HYP, and with the
latest release of MiNT 1.15.0 come a lot of docs...

>selector, asking me where to save it. I click OK in the file
>selector and it then gives an alert telling me it "can't create local
>file."

That's the same problem I'm having with it, although on it's own it works fine. If you're using Magic one way round this is to load up aFTP before CAB, place the mouse over the link so it comes up in the status bar and press ctrl-alt-I until aFTP is shown in the little box, and then enter the URL into the connection dialog.

>Any thoughts on what's causing this?

No idea at all. It's possibly not parsing the name correctly, ie. trying to create a file called 'ftp://some.server.com/directory/name/filename' rather than creating 'filename' whereever it's told to save it.

5404. Falcon for sale

Newsgroup: comp.sys.atari.st
Date: 1998-12-30 00:00:00 UTC
From: bsummer@delphi.com
Message-ID: <Jdc2YzX.bsummer@delphi.com>
Source record: 87316

Atari Falcon For Sale:

Atari Falcon with 84 meg internal HD,14 megs of RAM,
math co-processor installed, and RGB,VGA monitor adapters,
with manual and box. HD is loaded with all ORIGINAL
Falcon software, inc. Atariworks, plus much more.
Price in USA $650.00 plus shipping/COD.

I also have the external TOAD Syquest 88/44 hard drive,
which was a perfect complement for backing up internal
HD. The Syquest will write to 88 meg carts, and read 44
also.It comes with cable, and 7 - 88 meg carts.
There's a 14.4 ext. modem if needed.
The price of the Falcon and external HD stuff is
$775.00 plus shipping in USA/COD.

If there is anyone in the NYC area, that would be interested
in picking up the Atari Falcon, instead of mailing it, I will include
an Atari SC1224 monitor in excellent working order, for
free.

If interested, please leave Email for Barry Summer at:
bsummer@delphi.com

Happy holidays, everyone!!
Barry

Al,

You've hit on the age-old topic of platform vs. platform, or makes of the same. My answer is similar to yours - it does what I need it to do. The only short-coming my machine(s) have is the Internet. I'd prefer a machine that is better/faster accessing the web. I plan to rectify that with a PC early next year. Other than that, my Atari machines do what I need to do. I currently utilize a 4-meg Falcon, but have a number of older machines that will accomplish basically the same tasks.

-Dana

I have unlimited access, so it doesn't cost me anything other than
time to download a long file. The trick is to get all the way
through without any problems (assuming it's all in one file).

Your comments lead me to ask the question...why, if you have a falcon or TT, would a four meg ST be your main computer? That's like saying that although you have a cassette and CD player, you prefer your old 8 Track.

I'm not trying to knock the 8 Track, and I totally respect your right to use the computer of choice for yourself, but when you have better equipment?

I have an STE as well. It's not my main computer though. Try loading a 20 megabyte photo into Calamus SL on an STE using your black and white screen. When I was using SL on a mega ST, once the document reached a certain size, it was crash city. At least SL has the decency to tell you it's going to crash and ask you if you want to save first.

I loved my ST and STE, and the Falcon.

I loved my old Honda 350 too, but when I got a chance to get a 750, I jumped at it. I still loved the 350. I had a lot of fun on it, but given the choice of riding the two, I'd always go for the 750 for the greater horsepower.

Same goes for computers. The ST is a great computer and can still do a lot of things. There are some things it can't do very well, like manipulate large images, handle large Calamus SL files or move graphics lightning fast around a screen. I still have an STE, but it is not, by far, my main computer and never will be again.

Like everyone else in this newsgroup, I wish ATARI was still around, mass producing computers that offered power without the price. I wish there was a lot of new software being developed for it. I wish I'd never sold my Neodesk 4/Geneva combination. To me, it offered the best desktop and operating environment going. Thankfully, I never sold Calamus SL and it sits proudly on my shelf (beside the windows 95 version).

I wish there was a tooth fairy.

But there isn't....

Probably most people who have STs have upgraded to a PC, not a Falcon or
other TOS clone and use it to access the net. But just because they use
a PC to access the net doesn't mean they don't also use their ST and doesn't
mean they wouldn't like to continue to see the system supported.

Amiga 500, Mac, PC, C-64, and Apple][but not for the Atari ST!

So as you can see, I'd like to use my Atari ST for more than just MIDI
but only if I can find the tools to do so.

My 6 year old son, on the other hand, has an Atari ST of his own in his
playroom that's used for games, games, and more games. For me, the only
games I play are on the 2600.

Are these still available?

Can you still use a normal RGB & mono monitor with it, or do you need to get an SVGA?

How much would the board be, and how much space does it take up and how hard/easy is it to install?

AM.

I think therefore I AM.

I had the 500 and 550 drivers loaded. One thing I also remember -
did you also check your printer configuration .CPX? I think there were
options in it that determined what kind of printer colour scheme it
was. You may also want to check out the extended options in the CAB
printer dialogue (the ones that appear if you run CAB under MagiC, or
have WDialog installed).....

>I noticed that. One of these days I need to upgrade...

pretty much worth it in my humble opinion :) You should see the
options that appear in TrueColour. The DeskJet 540 has gotten a new
lease on life for the time being, between that and getting ImageCopy 4
I'm able to do some amazing colour printouts. Now if I can only be
lucky and get a 660 - my brother was GIVEN one by a professor at the
university where he works. The 695 also looks pretty amazing as well....

:I never said anything about wanting ST compatibility for all new programs. I said I
:was looking for information on STs. The newsgroups for other orphan computers has
:information on those computers. The ST newsgroup, to a large extent, doesn't.

understood. however I think there is a problem with terminology here.
you say the ST is orphaned, when it is not. It is just that development
is not proceeding in the same way at the same pace. The market as you
must know, for new Ataris(Milan, Hades, Medsua, Phenix?) is not large.
not large enough to support another newsgroup. And since most these new
machines and os's are backwards compatible with Atari software, this
newsgroup is the only source of info on the new machines(in usenet).
there is no longer much new development for the Sinclair, or 8bit computers,
so of course those newsgroups only talk about their orphaned hardware/software.

:And by the way, I didn't even start this thread. I merely agreed with the guy who
:came to this newsgroup, naively expecting ST information in an ST newsgroup.

yup. Tony Greenwood is back in town! :-)
he likes starting things! Tony is focussed on the ST, programming for.
he's a regular fireman, loves putting out flames! (hehe)

:> When you say this newsgroup is of no use to ST-users it makes me wonder if
:> you follow this group regularly?
:
:If I don't see things your way, your assumption is that I don't know what I'm
:talking about?
:I reiterate that the newer TOS machines look great, and I look forward to owning
:some at some point: this is not an issue where I'm bashing people who use different
:machines. The problem is that there's a newgroup for STs, and actual ST information
:there is minimal and buried.

there is actually a ton of info about the ST, STe's on the internet,
this newsgroup is only one source. If you ask a question, you'll get an answer,
if you don't ask a question, you won't get an answer. do you have a question
relating to the ST? Most questions/problems are relating to the newer soft/hardware.
just like the MAC newsgroup. or IBM newsgroup. this newsgroup is no
different. If development ever totally stops for the Atari computer,
then you will notice more questions about orphaned soft/hardware.
but then, at least SOME of those questions will be about Hades/Medusa/DirecTT,Milan...

:> As I mentioned, I have only got an STe
:> myself, but this group has been very valuable to me.
:
:Glad to hear it. Care to elaborate on how it has helped you so much?
:

:> Of no use to ST-users? I�m glad to tell you how wrong you are! :)
:
:Please do. So far, you haven't said anything that addresses my point. You've said
:I was wrong, and you've implied that I must not have actually read the group before
:shooting off my mouth. But what you've posted really just amounts to cheerleading.
:All I'm looking for is some information on what I can still do with my STs, because
:they're great machines. I've had wonderful luck reviving my 8-bit Ataris with
:newsgroup info, and my tone in this post stems from my frustration that the ST
:newsgroup is so filled with non-ST postings that it is of little to no use for
:someone wanting to revive an ST. I'd be very pleased for you to prove me wrong.

well if you are looking for info, ask!
or check out Hallvarts site, or Vezz's, or the Ultimate TOS software index, or...
I've got hundreds of sites in my bookmarks. want me to email it to you?

:I just doubt that'll happen, is all.

I think TOS was listed, but not the TT. Methinks they just forgot about it,
or included it within the phrase "ST and Falcon line". The blokes at Hasbro
probably don't even know what a TT is anyway.

Thanks. BTW, who is working on this? I'm learning Javascript (looks
easier)
and find it really awkward to have to test my pages by dumping them on a
floppy
then cruising to my parents place to test on their PowerMac. A
Java/script
plugin for CAB v2 would be a blessing!

Thanks again,

Chris Wilkinson.

I thought this was probably how it worked, and I can see that to change
it would be a major upheaval.

Is it possible to send queued posts one at a time, so that I could
reselect the .sig file as appropriate, e.g. whenever I recognised that
a different batch of posts had been started?

Alternatively, can I suppress adding the .sig file at upload time e.g.
by selecting an empty .sig file? I could edit in the appropriate sig
when composing posts offline, which would be transparent to Newsie, and
the extra disk space used would be at my choice.

Raymond,

these lines are in my Mint.cfg already, although the CoNnect stuff has
been commented out. Appearently, as Ronald already explained it is AES
4.10 being screwing things. Gotta wait for N.AES then.

Meanwhile, I've some other questions: how does one add packages without
reinstalling? I've added the Compiler now by simply reinstalling, and the
remaining X11r5 has to wait till I have a bigger HD available. Well, I
think I reinstall once again then.

The main question is: I can't get to the consoles. The installation was
done how it should be, entering a hostname, username, passwords etc.
Now when booting I get the following lines flashing by:

...
loading interfaces:
SLIP v. 0.5, four channels
PPP v. 0.4, four channels

Minix file system driver Version 0.60

TURBO mode

```
pid 0 (MiNT): unknown variable 'SECURELEVEL'
pid 0 (MiNT): unknown variable 'SINGLEMODE'

Booting FreeMiNT

and I'm going to AES 4.10 plus Thing desktop.

These are the lines in Mint.cfg I have (commented stuff left out)

SLICES=1
SECURELEVEL=1
cd c:\
## Die Seriellen Schnittstellen bekommen ordentliche Namen.#
ren u:\dev\modem1 u:\dev\ttya
ren u:\dev\modem2 u:\dev\ttyb
ren u:\dev\serial1 u:\dev\ttyc
ren u:\dev\serial2 u:\dev\ttyd
ren u:\dev\midi u:\dev\ttye

ren u:\b U:\.b

sln g:\usr\bin u:\bin
sln g:\etc u:\etc
sln g:\home u:\home
sln g:\usr u:\usr
sln g:\tmp u:\tmp
sln g:\var u:\var

sln U:\pipe\pty.A u:\dev\pty.A
sln U:\pipe\pty.B u:\dev\pty.B
sln U:\pipe\pty.C u:\dev\pty.C
sln U:\pipe\pty.D u:\dev\pty.D
sln U:\pipe\pty.E u:\dev\pty.E
sln U:\pipe\pty.F u:\dev\pty.F
sln U:\pipe\pty.G u:\dev\pty.G
sln U:\pipe\pty.H u:\dev\pty.H
sln U:\pipe\pty.I u:\dev\pty.I
sln U:\pipe\pty.J u:\dev\pty.J
sln U:\pipe\pty.K u:\dev\pty.K

setenv PCONVERT PATH,HOME,SHELL

setenv UNIXMODE /brUs

setenv PATH
\bin;\usr\ucb;\sbin;\etc;\usr\sbin;\usr\local\sbin;\usr\local\bin
(note this one didn't fit on one line here)

setenv HOSTNAME dinges

setenv AESDIR c:\multitos

setenv THINGDIR c:\thing

setenv TZ GMT
```

INIT=c:\multitos\init.prg

Now, I can comment the AESDIR, THINGDIR and last INIT lines out, but I'm always going to Thing in the end.

This way in fact I have the whole Minix stuff for nothing.

Finally, I put the pico editor into /bin and changed permission to 755.
Everytime I call it, it's giving me "unknown command".
This was done just after installing, when I was still in the console.
(I tried to use it instead of this bloody VI editor to change .chat-script)

I guess there's probably some setenv line(s) wrong or missing, but I can't find absolutely nothing in docs to get it going running from a console, or use the Unix part.

Ghostcript, only shows pages, and it converts PS (level1 or 2) to PDF
and viceversa.

You can find last version and font files (needed) on:

ftp.rz.tu-harburg.de
/pub/software/systems/atari/gnu/ghostcript/gemgs

It does not run under MINT 1.15/N.AES on Hades/Medusa

I do all of my reading/posting OFFLINE and when I do a posting I
hit the SEND button, that auto ads the file sig onto the message.
It works for me, I can change sigs per message or per newsgoup
and as I don't resave the settings, when the next time I bootup
newsie, it defaults to the normal sig.

Hello

This question isn't really to just Jeff, but to everyone.

I'm reading this thread with interest and have read the comments from some saying that most messages in this newsgroup concern MagiC, TT's, Falcons, etc. with not much info for ST users.

I was just wondering that if the above type of statement is true, could the reason for the lack of ST messages simply be because those using ST's aren't posting?

Based on my long history of using Atari products, I've always found Atari users to be the most helpful and friendly people I have known, and to me, this newsgroup should be an excellent starting point for those who have recently obtained an ST for the first time.

Just curious...

Source record: 87368

Hello

In a couple of message threads here in the newsgroup (especially the "Any real ST stuff going on?" thread) several people who have written messages that seem to imply that compared to a Falcon, TT, Milan, etc. that an ST is "old" or "limited" technology.

I'm not sure exactly what that means but I'm curious as to what people really want their computers to do??

My main computer is a 4meg STe with TOS 1.62. What can I do with this "old" or "limited" computer? Well, I write letters, balance my checkbook, make a family budget, modem, play games, create Christmas cards, maintain a database for my movies-music-collectables, write stories (one of these days's I'll finish my great novel... grin), create/play music, and many other tasks.

I've run a business, The Computer Dungeon, using my STe that included publishing a newsletter, creating advertising, maintaining a customer database, creating mailing lables, maintaining an inventory database, creating web pages, and much, much, more.

My "old" and "limited" STe does just about anything I could want my computer to do and I'm VERY happy with it. Though I own a TT and Falcon (and they are both excellent machines also), I have no real need or reason to replace my STe as my main machine with either of these. A Milan? Can't fathom what I'd do with it.

But I'm really curious.... what does everybody else want their computer to do? Why is an ST/STe "old" or "limited"?

(Just trying to start an ST discussion; no flame or insult intended to anyone.)

->
->--
->Alan Price
->http://www.postern.demon.co.uk

Hi Alan. I had just started to post a similiar suggestion when I read
your message! <smile>

Anyways, what I was going to say was make a folder in the editor that
you use called \SIGS (I use the excellant QED). Uncheck the option that
adds a SIG to your messages/posts. Then right before you save any reply,
message, post, E-mail (whatever), just merge the SIG you want to use. I
use Freedom's path feature to take me right to C:\QED\SIGS\ (and Selectric
would do this too), where I pick the SIG I want, save and send it. Neat
and simple. ;-)

Hi Al,

it's beginning to get interesting... :-)

Strictly my opinion (as is everyone's entitled to his/hers>

I think/consider an ST as old. Period. Say about 10-13 years, isn't that
old? Gawd, a P-130, just a few years in age, is OLD!

Won't prevent the user from doing what he does. Could be anything.

My TT is old. GFX card, 64 megs fastram, CD-ROM drive, more than 2 gigs
diskspace, SVGA monitor, no matter what, it's OLD.

Now are these machines therefore unusable? NO WAY!!!
Some are sitting in closets, gathering dust indeed. But many, many, many
of them are still operating. I gather no-one really knows how many ST's
are still functioning. The problem is: the vast majority of their owners
operate them out in the dark. No Internet, no connection to BBS-es, not
even knowing of other users around. A vast amount of users probably
operates without harddisks, I figure.

Who are the people in this NG? First, they're all somehow connected to the
Internet. Either directly, either gated (the first months you've seen me
here was gated too). Secondly, most of them have probably upgraded their
machines. Don't think running Internet on a 1 Mb machine, no HD, mono

screen is much fun.
Now if you put one and one together, that makes more users with more modern stuff (more memory, bigger harddisks, newer hardware, capable of running in hi rez colors, just name it) surfing the Net than the ones sitting with an ST, no harddisk and an SM124 on the Net.

Why do people get on the Net? To support their local phone/cable company by spending hours surfing around to just see what's up there? Don't think so. My reason was simple: I need support. For an Atari. Get it from shops... where? Used to get it from a bunch-o-freaks gathered around a BBS, using a mailer/point system. It thinned out immensely during the last 2 years, leaving around zero left. So, support gone again. You're a stupid loner out there in PC-country. Know the feeling?
So I joined the Internet. Glad I did. Found lotsa Atarians, from all over the world. One's on a simple ST, small HD, mono screen. Some have colors. Others have 060 Hades, or the latest Centurboed Falcon. Several of them on PC's or Mac's running MagiC. So what's the deal? I think most of these people connected to stay up with their stupid old hardware. Bunch-o-freaks indeed. I am. Never had so many config problems as now, trying to keep up with 3 OS-es as compared to when I started out with my first ST, floppydrive and monomonitor.
But I'm not giving up and that's why you will see another stream of questions from stupid Unca Lewey when he's got stuck again next year (and it won't take long, I'll guarantee!).

In the meantime, I do answer questions when I think I know the answer, that's what I'm here for too. Kinda give-'n-take. Sometimes I'm wrong, then again who isn't sometimes?

I haven't logged them, but how many times did I see a message like "got an ST from a friend/found one on the belt/my uncle died and had one under a pile of dust; now how do I operate it? Have no floppies with the OS... Please help! And the next one, Nick patiently explaining: "Read the quick FAQ".

Nope, don't split up this NG. The two parts will probably die. And don't whine, when you see more refs to Hades/Milan than to a simple old ST. Did I whine about the numerous cries for help to get an old ST going?

Well, if I'm not interested in SW only capable of running in ST-Hi that's my opinion. It's my decision too, thank God for that! If then the programmer decides not to work on it any longer, that's his decision.

Don't whine, just get on with it! (Yeah Lewey, easy said after you nearly gave up on Mint!)

Happy New Year everybody!!! And don't let this NG have a Y2K problem!

5443. REQUEST: Looking for Atari Fuji symbol

Newsgroup: comp.sys.atari.st
Date: 1998-12-30 00:00:00 UTC
From: onlyinohio@aol.comN0spAM
Message-ID: <19981230114306.02219.00003937@ng28.aol.com>
Source record: 87375

Hi folks, I was brought up on the Atari 400/800 and have a number of demos that had the Fuji symbol. Some had rotating colors, some were 3D, and some even rotated the entire symbol.

Does anyone know where I could find a large Fuji symbol like that to use as the opening screen in Win95? Or as a screen saver? I've looked all over and can't find one anywhere. Would have thought with the Atari's continued popularity somebody would have ported over a 3D Fuji to the PC.

Any help appreciated. Remove the "nospam" to reply. Karen

Source record: 87377

Hi Fellows-

I'm one of the returning ST users somebody refered to (had an STf for music early on, let it collect dust for a while but I'm back in it with a vengence and bought a Mega4 ST fairly recently). Speaking from this point of view and as one who has gotten a bit of help (notably from Nick Bales and his FAQ), I must say the large number of posts having no relevance to me don't really bother me and I find info of use with enough regularity to return often. (i also just almost spent every last penny I got on a Falcon, then balked...)

I have posted questions and got response re: 1 of my 2 Megafile 30s not reading (haven't resolved this by the way) and got no response to an inquiry about Sound Merlin (I'm going to post another about this and related sound problems very soon 'cause its bothering me...)

As for new programs, I must plug Electronic Cow: Danny's program's are very easy to use, powerful, fun, inexpensive and run on my old boxes and y'all's souped up machines as well. Couldn't ask for more...

No dis intended to many unnamed helpful people showing themselves here and behind the scenes, all helpinng to keep Atari from falling in the grave somebody's dug for it!

If you have a question about something on an ST, this is the place to ask
it. Just reading thru the messages in hopes of finding something useful
to you probably makes it seem worse than it is. I still use an ST and I
frequently find some reference here that points me to software for the ST
that I didn't know existed. I don't ask ST questions much anymore, but I
see that other folks still do.

I didn't mean to imply that you suggested splitting up the newsgroup.
It was addressed within this thread, and I was just voicing my opinion.

Second time that one's been mentioned. Thanks!

This is a pretty good site for Falcon demos:

http://grelb.src.gla.ac.uk:8000/~mjames/computers/demos/falcon_030.html

However, it rarely tells you if a demo is VGA-compatible, and some of
the FTP links don't work.

> Now are these machines therefore unusable? NO WAY!!!

Indeed. Both my Stacy and TT see daily usage as web production tools.
Nonetheless, my TT could use a GFX card and Ethernet adapter.... ;-/

> the vast majority of their owners operate them out in the dark.
> A vast amount of users probably operates without harddisks, I figure.

Yep. Both TAF (Toronto) and MACAM (Montreal) surveyed their members.
The average Atari user is:

1) a musician
2) using an unexpanded 1040 STF
3) runing Cubase or Notator
4) without a hard-disk
5) not online (Internet = Windows 95, for most people)
6) not aware of recent developments (not interrested either)

Result? You see 3 kinds of people on this newsgroup:

1) die-hard user who upgraded to TT/Falcon/Hades/Milan

2) NoSTalgic looking for Magic PC or emulators info

3) just woke up and realized I got an ST in the attic,
but is it good for anything? Can I upgrade the BIOS?
A: Nick patiently replies: "http://quickfaq.atari.org"

This is the current state of the Atari ST universe, Circa 1999.

Happy New Year y'all! ;-)

AL:

Well said! I think anybody in the PC/Mac world would call ANY atari
computer limited. But it comes down to needs. Do you really need the
fastest souped up up-to-date machine. Or does it do what you want it
to do?
Myself..I have a TT030 and a Mega Ste. My Mega does things that my TT
can't!...like run applications that will not work on a TT because of
the different TOS structure.I use BOTH systems at the same time when I
am composing Music. I can put boot up Hybrid Arts LUDWIG (algoriyhmic

composition package) which will NOT work on the TT, and record
directly into Cubase on the TT. GOOD COMBO! Also I use the Mega for a
super Game machine. It runs from disc (no HD) so all those games that
are meant to run on disc DO!! My TT , I use for Net stuff (cab/newsie)
and also art and DTP (pagestream 2.2)
I also use a 486 PC my wife got me for 20.00! Mostly MS office and I
am thinking of Digital Audio to run in synce with the Atari (for those
of use that do not have Falcons)
As far as splitting up the newsgrps..I think we should be one happy
family.We can learn from ALL the Tos machines, even the 8 bit ones!

It certainly looks good, and I like some of the ideas it incorporates, though it's certainly very different to other Atari emailers I've used.

Setting up was pretty easy, but I do think the docs should be available in something other than HTML format ;-)

A program well worth keeping tabs on that's for sure. I dare say a review in AC might be on the cards at some stage in the near future. We've already mentioned it in the CyberSTrider files in AC#10 - but that was v.0.63.

Kind regards

5456. Help: "sound system locked"

Newsgroup: comp.sys.atari.st
Date: 1998-12-30 00:00:00 UTC
From: Rick Brown <rbrown@ymail.yu.edu>
Message-ID: <Pine.A41.4.05.9812301415500.41154-100000@acis.mc.yu.edu>
Source record: 87388

Fellow ST-users (and those who might remember being one):

I need to figure out an odd message I'm getting with my Mega ST4
when trying certain sound-producing programs (notably Electronic Cow's
otherwise fine products). Since the Mega ST has no "Sound System" per se
(just the monitor, or the Monitor Master I use to supply a line to my
mixer), how can it be "locked"?? Anyone else ever have this message come
up? Could it have something to do w/NeoDesk? Is there some hidden prg or
acc running that gives my machine the impression it needs to lock
something away ....??

I wonder also if this could be related to an odd phenomenon I get
with Sound Merlin: sometimes (usually) the play buttons just play a spurt
of the intended sound, just a micro-second instead of the complete file or
window. btw: does anyone know of the current existance of Tommy Software
of Berlin, the developer of SoundMerlin? I'd like to register my copy
and/or get docs...

There are no barriers to ST users in this newsgroup. If there is
nothing useful to them it means that they are not contributing
anything of use.

This explains your pico problem, It HAS to fit in 1 line.
Use a good editor, pico, vi, QED, everest whatever.. Make sure it fits.

>
> INIT=c:\multitos\init.prg
It should NOT go in the aes as you have this line INIT.
Are you sure you don't have any GEM=something ?

The rest looks ok.

Hi to all,
I've received a few midifiles attached to emails
recently and Newsie doesn't seem able to decode them.

I've noticed that these attachments are described as Base 64
encoded, and would be grateful if someone could advise me of a suitable
program to decode them.

My thanks for any replies.

5462. Serial Port Upgrade

Newsgroup: comp.sys.atari.st
Date: 1998-12-30 00:00:00 UTC
From: mike.borsley@zetnet.co.uk
Message-ID: <76e3bn$2fr$2@roch.zetnet.co.uk>
Source record: 87394

Hi everyone,
I have another problem yet unsolved.

I upgraded the serial port on my STFM some time ago and couldn't get
it to work. I'm using Stik, and changed the Baud rate in DIAL SCR to 38400
and experimented with a few different settings in HS Modem but must admit I
don't know what I'm doing with that.

I used a 4040 chip for the upgrade as per an article in Atari World.
I've checked and double checked all the connections, even tried a new chip,
but it still doesn't want to play ball.

I noticed in the HS Modem Docs that it refers to MFP PRG.TXT which
might give a bit more info, but I don't seem to have that with the package.

I would be glad of a bit of help from anybody who has upgraded their
ST and could advise me what settings to alter in Stik and HS Modem.

Fortunately I've fitted a switch to bypass the upgrade and can easily
switch back to 19200 where it works fine.

My best wishes to all for the New Year.

> whatever they want.. and YES an ST user will get help if he asks..

YES YES YES, are you having an orgasm or summat Tony? :)

Although my ST makes me horny, but that's another story :P

> I may have missed a message.. but can someone show me a message in
> THIS thread where someone suggests splitting the newsgroup ?.. because

Yeh, here goes:

I suggest we split the group! :P

mooha :P

Get out of that one then :)

Umm, Falcon owners can only post on Monday & Thursday, unless accompanied by a TT owner when they can post on Wednesday also, unless they have an upgraded Falcon in which case they can only post on Wednesdays and Saturdays. ST owners post on Sunday & Tuesdays unless accompanied with a TT owner and then they too can post Wednesday, but only in the morning :P Clones can only post at Friday & Sunday unless accompanied by a real Atari :P

That's a suitable arrangement if you ask me :P

/me walks off laughing uncontrollably

There are some command line switches in my version of "cat" that allow
conversion of line ends. However you will need to run it from a shell
or a desktop which knows about shell scripts (because it needs
IO redirection).

If this is fine, try the Mupfel tools collection from:

http://www.muenster.de/~reschke/soft_e.html#mupftool

I've now got a Falcon as my main workhorse and that produces most of Atari Computing's magazine artwork - yep, that's right! I use Papyrus v4 to do all the layout. The Falcon does all the other stuff connected with the magazine, admin, graphics etc. I don't have a PC or a MAC.

I've sold all my STFM/STe's, apart from one which is being 'fixed' by TUS, but I've recently acquired a Mega ST for the wife for her to play with.

My old STFM's used to produce a monthly magazine for the UK radio industry and maintain the database for it without any problems. However, I couldn't produce AC on a 4MB STFM because there's simply not enough memory to load in all the graphics/photos that appear on most pages in AC. I need all the 14MB that the Falcon gives me, and sometimes it's a real squeeze then - but I've always found a way around the problem and not had to resort to using someone's PC or MAC!

I've no real need to buy a PC or MAC because my Falcon does all what I want and will do for the forseeable future.

The only thing that bugs me is the wallybrains that write web sites that expect you to use IE or Nutscraper and won't let you browse their site because you're using something else - WAKE UP Carphone Warehouse in the UK, you lost a customer because of your arrogant message!

Thankfully there are decent web site creators out there that don't assume we're all running Wintel shit and keep to the true spirit of the WWW/HTML!

And just to add my few pence to the discussion about this newsgroup; I reckon it should cover all Atari and clone machines. As a Falcon and an ST owner I find nearly all postings in this group to be of some interest.

Nuff said, now onto getting AC#12 ready for the printers!

:-))

Happy New Year everyone!

Kind regards

Mike Kerslake

What hard disk driver software are you using ? What exactly happens when
you boot up ?
Does the driver list the quantum drive when booting? Have you tried booting
from a floppy disk, then switching on the drive, then running AHDI or
whatever driver you use from a floppy ?

>
Hi Chris,

see how one topic shifts attention back to the old ST? :-)

You got one nice point here: in fact that's what I keep my ST for too,
running stuff that won't on the TT. Flightsim II, astronomy stuff. I have
these programs Planets, Astrolab, Sternbild that won't run on the TT.
By accident I got an upgrade for Astrolab that I've never seen before,
which runs on the TT, but the database is different from the earlier
versions and it doesn't show as many stars as the previous version I got,
0.7...
There must have been versions in between, I have one 0.6, then 0.7 and
the upgrade I found is 3.17 IIRC. The programmer left for Down Under a
few years ago and 3.17 was the last one he'd got out.
Anything on this Atari Planetarium? Was it commercial? Color or mono?
Just interested...

Happy New Year!

Ronald, I took the Syquest because this 1 Gig drive hasn't come back yet.
I wouldn't wait for it, so that's where the last cartridge I had available
came in handy. But, it's for the basic stuff only, I can fit X11 on it but
then have no more room for more stuff. And I just fetched Pine 4.05...
When this 1 Gigger gets back here, I intend to create a 400 Meg Minix on
it. I need the rest for "atari" storage.

BTW, testing/evaluating N.AES takes time too! So far it runs perfect,
although moving of windows is REAL sluggish as compared to MagiC. Mite be
a setting, tho'. Also it doesn't handle fonts other than 8x16 in
the AES nicely, especially not in Thing. One more bonus for MagiC here :-)
But, like I said, I need more time to figure it out.
At the same time I'm "learning" Unix... See the problem?

Happy New Year!

<>

Hello Tom

Well, as I said in my main post, the reason I use the STe as my main machine is because it does everything I want it to do.

Maybe if I manipulated big graphic files, or got into a serious music program that required much HD space and memory, or created huge text/DTP files that required more computer than my STe, then I'd use the Falcon or TT to perform those tasks. In fact, I bought the TT to become the main workhorse" of running my business, especially doing DTP work.

I use my TT and Falcon pretty regularly and enjoy them both. And they both have strong points that could make them more preferable to use than an ST, depending on what your requirements were. I was just commenting that despite what many might consider to be a "limited" or "old" computer, my STe still has a lot of life in it and performs all the tasks that I require my computer to do.

I was also curious as to what other Atari users are using their machines for and have found the answers interesting.

<>

Better? That depends and is kind of subjective. Beauty is in the eye of the beholder.

Thanks for your input!

Al Horton

I have enjoyed reading everyone's response to my post and want to Thank everyone for taking the time to give input.

I hope others will post also as I find it interesting reading to learn what others, in this Microsoft dominated world, are doing with their "orphaned", "old", "collectable" machines.

Thanks again to all and I look forward to reading more posts.

> The VELOCE+ Accelerator is now an established product

Excuse me? Established products are things everyone has and whose
track record is proven. Your website doesn't even have specs of
your products, nor a pricelist, nor ordering infos for non-UK users.

(at any rate, it didn't last time I visited it).

If you want the Velove+ to be counted among the classics, please
write up a proper web page about it (and the IDEal too!). ;-)

Well.... I think that every computer is only so good ,as his owner can use
his features. And this is with every tool, what people using, not only
computers.
I still use my old ST for some work, like EPROM and GAL programming, but
it has no chance comparing to my PC. Perhaps main problem is in picture
quality - I don't have monitor for ST, only TV with RGB input, but it is too
poor, and resolution is very limited.
Of course my PC is limited too. I can't manage over 30 FPS in Quake 2 with
375 MHz CPU, and Riva 3D card. And it will be so always.... Everything will
be exceeded very soon, this is price of progress.

Don't sorry too much for your 'old' Ataris, every today's new PC will
after 5 years be old, and poor machine.

Pera

Hi,

I know there's several N.AES users here and since the handbook wasn't sent by the ST mag editor, I can't find it in the hyp.

I changed the winrealtime to false, since the realtime movement is terrible here. Looks like a movie running at 5 frames a sec. Check this out with MagiC, it's perfect there.

Thing (my version, 1.26) is a laugh. Menu's OK, but all the config boxes refuse to display most characters. All the text drops simply out.
Have tried with systemfont, Rufus several sizes, Swiss 721 prop incl. a cellmodel setting, nothing OK. Some other apps, like Newswatch or Popwatch loose a few characters too in the boxes, while Menuinfo displays just fine. Don't have a clue how to get around this.

Anyone with a solution for these problems?

Otherwise, for the time being, I think N.AES is just fine. Well, didn't like the N.FSEL either. So I stick with Freedom :-)

These probably (!) the last questions for 1998. Wish you all the best for 1999, don't mess around with the firecrackers, you'll need some fingers to type your keyboards... :-)

And after all this toiling and moiling since around X-mas to get everything going, I think I deserved champaign anyhow...

See 'ya all next year!

As for me:

I started back in '89 (yep, as of December '99 I'll have been an Atari user for a decade!) on a 520STfm that I bought with a loan from my boss at my work. Hooked all 512K of it to an old B&W TV that had been in my family for about 30 years (the durn thing is tube-driven!). After two days I bought my first program for it, First Word Plus, and began using it for what I had bought it for, word processing.

A mono monitor followed (followed by my discovery that colour games wouldn't run on it :x). Then an upgrade to 1 meg. And then a hard drive. Each new addition made me fall more for my computer even more. When I got my first printer (a Star NX1000), I began to "pay back" the store by designing signs and flyers for it.

A big jump was when I joined TAF in late '90 - here I found many users just as enthusiastic for the platform as I. And I soon found my niche in the club - writing product reviews in the PHOENIX. With the education I got from the many demos of product and tutorials on how to do things, I became a power user - to the point that I bought a 4-meg STe in '92, built my own hard drive in a tower case, bought a modem and began surfing first BBSes, then a commercial service (GEnie, RIP), and then dipped my toe into the Internet.

These days I'm using a hopped-up Falcon with an SVGA monitor, and have a scanner, an HP printer and a Syquest drive (I also have a Mac Powerbook to use when I travel, which then gets its contents transferred to the Falcon where the real work gets done :)) I'm running MagiC, and I'm having great fun with all this. Even have two STfms in storage, mainly as spare parts (like the keyboard) but I have additional fun with them occasionally when I need to play a game or run a program - I'm still a kid at heart with these things.

For the heck of being an ST-only user who appreciates this Newsgroup:

I have a STfm with 4MB (recently upgraded, with help from people in this NG) and a "hard drive" (Zip, actually), parts acquired and installed with help from people in this NG, and several programs, found (and even written for me!) by people in this NG.

As a ST-only user, I have found this newsgroup very helpful, both in responses to questions/comments I originate, and in following other users' discussion threads. It's true that wars over which is better, Magic or Mint, are tiresome for those not actually involved in either side, but my take on the Magic/Mint/Milan/Hades traffic is that it shows there is life and activity in the TOS world.

Which compares very favorably to the near absence of life in my platform of choice, the TI-99/4A. May the ST (and compatibles) long avoid the creeping obsolescence in the TI world.

My opinion is that there is room for all TOS-compatibles in this group. If someone wants help with his old ST or a new Milan, there is usually someone who can help out. Every question I have asked here (most of them ST-specific) have been answered very quickly. My opinion is that there are to few atari-users left to allow us to split this newsgroup into smaller, more specialized areas.

> And by the way, I didn't even start this thread. I merely agreed with the guy
who
> came to this newsgroup, naively expecting ST information in an ST newsgroup.

And I believe there is plenty of it, but not exclusively ST-info. I agree that this has become more of a TOS-forum than an ST dito.

Not at all, I just wasn't sure if you had been following this group very long, that's all. My question wasn't ment as an insult, it's just that this group has been such a useful ST-resource for me that I couldn't understand your point of view.

> machines. The problem is that there's a newgroup for STs, and actual ST

I don't know what kind of info you are looking for, but people here has helped me out with ie. memory-upgrades and info on where to get utilities and software. All for the old ST. I asked, and people answered.

> All I'm looking for is some information on what I can still do with my STs, because
> they're great machines.

Agreed! And I believe this is the place to post your questions to find out what you want to know.

> newsgroup info, and my tone in this post stems from my frustration that the ST
> newsgroup is so filled with non-ST postings that it is of little to no use for

C > main machine with either of these.

Frankly, mostly I agree with you, but there are a couple of places
that 'I thank the stars for my TT':
1) I used to do newsletters in PageSCream on an ST. The TT scrolls
much faster, and prints much faster (and crashes less, but that may
be due to the flakiness of /my/ ST - may not apply to yours).
2) FirstCADD not only works on the TT - it also prints about twice
as fast.
3) With its rather non-finicky scsi port _and_ an acsi port, the TT
makes a pretty good test bench for hard drives and such. In my
experience, if I cannot get a hard drive running and working as an
Atari drive on this TT, it is probably a) seriously dead, or b) will
never work with any TOS computer.

Other than those 3, I would still be happily using my ST, and
wondering whyinhell anybody needed anything more.

M > these attachments are described as Base 64 encoded, and would
M > be grateful if someone could advise me of a suitable program
M > to decode them.

Esscode should be able to handle them. Base 64 is mime, iirc. And
here's a tip for running esscode: if you have tos 1.4 or above, turn
on the 'tos 1.4 file selector' switch in the config menu - that way
what the program intends to do next will be easier to follow.

"The Poor Deluded Soul" - tderrick@acpu.com

<>
<>Hmmm... I can't help you on this bit :-}

<>http://www.cix.co.uk/~derryck/software.htm
<>
<>But here are my HS Modem settings:
<>
<>DRVIN.PRG:
<> FASTINT: Off (But switch 'On' if you're not using MagiC.)
<> EXOPEN: Off
<>
<>MFP.PRG:
<> RSVE: Off (Switch 'On' if you need to use older progs.)
<> REPL: u (6x) (Put 'u' into each of the six fields here, unless
<> you have RSVE switched on. These are to re-map
<> baud rates e.g., >=38400 in MODEM.CPX.)
<> DTR: On
<> RBL: 256
<> TBL: 256
<>
<>AFAIK you shouldn't need to switch RSVE 'On' if you're just using
<>STiK/NEWSie etc. The RBL/TBL values may need to be changed, but try
<>them as above first.

Yes I've set everything as above.

<>And just a double-check (you've probably got this bit OK already),
<>place DRVIN.PRG, MFP.PRG then STIKTSR.PRG in that order at the
<>hind-end of your AUTO folder :-)

More or less, I did have NVDI between MFP.PRG and STIKTSR.PRG so I
moved that.

<>Also, if you haven't already done so, setting your modem to report DCE
<>rate instead of DTE rate will tell you for sure if the upgrade is
<>working (I had to add 'W2' to my modem init string, somewhere after
<>the ATDT bit) :-)

Does that come on the line :- PREFIX=ATDT or INIT=ATZ ? I'm using a
Suprafax 28.8 Modem.

Well I tried it without this last edit, and I seem to be getting the
same results. The modem dials out and gets through to Zetnet but the
telephone no. stays in the STIK dialogue box and thats quickly
followed by three bombs.

On switching back to 19200 I found I only needed to replace the Baud
rate in DIAL.SCR to 19200 and it works fine with the revised
settings in HSMODEM.

I guess I'll have to carry out further checks on the upgrade.

<>Happy New Year,
<>Misha

And to you - its nearly here.
Thanks again
Mike

>But I'm really curious.... what does everybody else want their computer to do?
>Why is an ST/STe "old" or "limited"?

Differentiate between "home" computer and "working" computer.

A "working" computer has to have certain capabilities for the job you're doing. OR appeal to a broad enough market segment (hence the success of the despised wintel). This it the best argument for Falcons and Hades and such.

I can't think of much that a "home" computer needs that a stock 1MB ST can't provide. Well, put a hard drive on it for convenience. Word processor for letters and school stuff. Spreadsheet for budget. Database (even a roll-your-own based on text files) for tracking your baseball card or videotape collection. Games for fun. Educational stuff. Programming languages for whatever. What more do you need for home uses?

The only thing that really comes to mind is how the stock ST is unsuited for Web browsing in color. I haven't tried it yet (which says something for how much "home" use a Web browser is), but I understand that the best a stock ST system can do for browsing is mono, by which you loose a lot of the appeal of the Web. But even then, you CAN use a stock ST for web browsing!

>I'm not trying to knock the 8 Track, and I totally respect
>your right to use the computer of choice for yourself, but
>when you have better equipment?

Partly nostalgia, partly because that's where your data files are, partly to support the community. My TI-99/4A is still my primary machine as far as budget keeping goes (all my Multiplan spreadsheet files are on it, and not exactly portable), and TI-Writer still sees marginally more word processing than anything on the Atari (even if 40 columns is a pain). The VT-100 terminal emulations on the Atari beat out the best of the TI programs, so that's what I use for telecommunications.

But I use and promote both to support both alternative computer user communities!

So even for most "home" uses, a 20-year-old TI is fine. A lot of Atari 8-bitters would probably agree. For "work", my TI just can't handle video like a stock STfm, so I use the latter with the excellent DIRECTOR program to sequence slide shows.

Certainly the Atari is better equipment than the TI. But one could successfully argue that your typical wintel is better equipment than

the best Atari compatible (if not strictly on performance, then on
software selection and availability). I don't think we'd want to
pursue THAT one very far!

Now, why I still use an STfm, not a falcon, not even an STe?
a) It does the job. [MOST IMPORTANT CONSIDERATION]
b) $$$. I'm seriously broke, and will be for much/most of next year!

>Can anyone tell me which color printers work with Ataris (and in which
>programs), where I can find printerdrivers for various programs etc.?

The DeskJets work very well, as long as you don't get one that
requires Windows (many say they do, but they really don't). Before
buying a specific model, it may help to ask about it here.

The best thing about the DeskJets is there were many programs written
specifically for the DeskJet 300, which was very popular for
Atarians, and they still work with the newer DeskJets.

For example, HP_5260 allows you to easily print labels on Avery-style
sheets. And it only works with DeskJets. (There are other solutions
for other printers, but perhaps none easier to use.)

FWIW, I have 2 Ataris in my office. The 1040Ste 4/540/21mbFloptical is the most often-used tool in the place.

My newly-aquired TT 4/4/540 is still making itself known to me, and that only after a monitor failure which put the TT out of commission during the 2 months that it took to repair the dead 19-inch monitor. BTW that monitor was repaired as a DIRECT result of a contact which was sent me after I posted a `cry for help' on this <comp.sys.atari.st> newsgroup.

Thanks, Martin! Bernie was very good at the repair, and took the time to show around his house when I went to Trois-Rivieres a ferw weeks ago.

IMHO the hard-copy 'zine ST PLUS has the potential to link together what is left of the community, taking up the slack left by the failure of CURRENT NOTES and the abortive attempts by the various User Groups who sporadically published the BIG ATARI NEWSLETTER in 1998.

The ST PLUS publishers should post here when each issue is about to publish, and should regularly put out a call for submissions.

Bravo Al. I have a 4 meg 1040 STe as well. Problem is my business keeps me in the car for so much of the time. I need a flexible update-able database that can freely flow from a desktop to a palmtop. For a while there I was hoping to get a STacy/STBook/Portfolio into my kit but they are rare, expensive (even today, on ther used market) and they have their limitations. I regret to say that I see a Pentium in my future.

If I didn't have this accursed need to be on the road all the time (I am a piano tuner/technician by trade) my Atari would suffice for another 10 years, at least.

I think the program that will handle the crlf situation is 'UNFORM30.PRG'
by Bill Aycock and is on his CAL 6.3 disk and is freeware.

>program to decode them.

AFAIK the Newsie package contains all what is needed to decode Base 64
(Mime) and UUencode message. Somewhere in the package there must be two
prg's. One called munpack.ttp, the other one uud.ttp. I though munpack.ttp
is the one you need to decode Base 64 message.

Furthermore there is ESScode and Marceau. The latest one is a very nice
and easy to use Mime decoder. Unfortunately the docs are in French.

Both programs can be found on the Belgian ftp-site 193.190.205.13
For ESScode go to atari/Archivers and look for esccd64.zip
For Marceau go to atari/incoming/utilities and look for marceau.lzh

You are probably talking about the TAF package. I've used this for years.
The X11 stuff however was just too slow on my TT030 to be usefull. However
back in 1995 it was the only way to brows the web. Long before Cab was out
I was surfing the web with a browser called Chimera. This browser was
usable if you had the time. In 1996 I did even a show at Heist-op-den-Berg
in Belgium with my setup. You maybe recall that. I remember I've talked to
a few people of the Stichting ST.

Are you using Wdialog? Don't and if you need it runs it from the desktop
or from n.aes.cnf. Wdialog version prior to 2.04 contains a bug. With
v2.04 you probably won't have this prob.
But as I've said before, avoid using it.

>>>With NVDI 5 combined with MagiC 6, printing all happens in the
>>>background! :)

Sure it does but like you says you need MagiC otherwise you may forget
that background printing. Here with N.AES it's just impossible to do that.
Furthermore for non-MagiC user NVDI 5 is more a step backwards then
forwards. Since I've NVDI5 it's impossible to print from Cab 2.7 in 300
dpi greyscale. With NVDI 4.11 I could do this. I could even print in 600
dpi greyscale.
Some weeks ago I added some 64 mB RAM to the 32 mB I already had. Now I
can print in 300 dpi greyscale again but 600 dpi is still impossibe.
The 600 dpi greyscale print mode is a real RAM eater. From the 90 mB RAM
that's is available at the time I give the command, only 20 mB are left
and even this is not enough to print.

For the most it very good, for others it's a pain in the ass.
Apart from aMail it's however the most modern looking mailer. The major
drawback is probably that it's design to runs on colorscreen. I think it's
even almost impossible to use it on b/w mode.

This is what the docs says about it.

What you need ! AES supporting animated colour icons (N.AES, Magic, MultiTOS, TOS 4.xx).
16 colours or more.
STinG or STiK installed.
>>>

Me too have serious problems with Mymail but only when I use MiNT/MiNTnet.
Most of the time the mail retrievement is aborted before I get my mail.
Sometimes Mymail crashes so seriously that it take the whole system down.

When I use MiNT/Sting I don't have these problems.

Source record: 87325

Nice to see your all still actively using the ST's, TT's and Falcons,

After having read the subject of the infamous TOS ROMS, i thought (rarely happens) id
drop a quick note about a few points raised, firstly KEVIN i wonder where the idea came from,
your mate in manchester ?. I see that you mentioned the price for a PCB, TURN PIN SOCKETS, CABLE,
SWITCH, INSTALLATION MANUALL(had to be written you know), DISC, set of DUAL ROMS from ***** SW,
LABOUR, ADVERTISING and of course VAT all for 47.99 inclusive when everyone else was charging much more
IS THAT EXCESSIVE ???? - I THINK NOT. On the question of did i use your old TOS ROMS and reblow them
to use on one of my 50 quid or so boards the answer is quite simply that if you can fit 256K of info into a 128K
chip then you should patent the idea as the rest of the computer world would love to know how youve done it. The
answer is of course dusty bin. Kevin i would suggest that before you put finger to keyboard in the future
that you think about what you are typing and curb your remarks. It is dissapointing to read such **** when
one has gone out of his way to provide good reliable hardware in a small market.

Hi TREVOR nice to see your still active, hows the weather down there. The Tos roms you where typing about
where indeed ROMS and could not be reprogrammed (DROP KEVIN A LINE HE MAY KNOW HOW TO DO IT)
so these would also of gone to silican heaven. As with all the other roms removed during a Veloce+ upgrade.
I have taken note from other comments and i will start to return all the old TOS roms removed from any machine.

The VELOCE+ Accelerator is now an established product and i need to compile a list of software
that runs on the 68020 processor, with and without fast ram. If anyone can assist please send any
lists to dave@REMOVETHECAPITALStusdev.demon.co.uk so it can be put on the new website.

Happy/Merry new year to everyone

Spelling mistakes probably included (look at how i spelt cookie on the veloce driver)

DAVE ESCOTT.

> from Hyperpaint 2 / GDOS on his Citizen ABC colour printer.
>
> What does he need to do this ? a Citizen printer driver for Hyperpaint ?
> and if so where can I get him one ?

He needs a suitable driver for GDOS. However, this might be a problem as
the GDOS which comes with Hyperpaint is an early version and new drivers
will be hard to come by, especially colour ones.

Hyperpaint will work with later GDOS versions but not without problems,
IIRC.

A better option might be to buy Imagecopy, which is commercial software
from the FaST Club. The web address I have is:

http://www.compulink.co.uk/~sta/index.htm

... but it might be out of date. You are sure to find an up to date address
on Hallvard's pages.

Imagecopy is a picture viewer/converter/printer program. It's still being
developed and is likely to support colour output on your friend's printer
either directly or via one of the printer's emulation modes. It has a
reputation as being just about the best Atari package for output quality in
colour.

IIRC William Wong did a couple of screensavers (announcement of which
touched off an unpleasant little flame war, IIRC) some time back. I guess
they'll be at his Probe House Software page:

http://www.geocities.com/SiliconValley/6880/phsw2.html

If that URL doesn't work, check Hallvard's pages for an up to date link.

to do?
> Why is an ST/STe "old" or "limited"?

I think I used the word "limited" in that other thread, while pointing out
that you can do most things on an ST which you can on the upgraded
hardware. The limitations I was referring to were mostly colour work
(320*200 in 16 colours is not wonderful for this in this day and age) and
memory issues (Calamus SL seems much happier with more than 4 megs, as does
Papyrus when using a lot of pictures, or everything when multitasking in
general).

I guess other limitations not covered by that context boil down to software
specifics, such as my need for a more powerful programmable database
package than is available to my knowledge on the Atari platform, some of
the newer web stuff and also a need to get to grips with certain PC
software, a working knowledge of which is helping me to keep in work. These
are *personal* requirements (eg Twist is fine for everyday database use,
but not if you want to get into producing database "applications" of the
kind readily doable in Access), which is why I now run Magic-PC, though I
still have my trusty and reliable STE (handy for when the PC breaks...!).

If you haven't got such specific needs, then as you say there is not much
you can't do with a little ingenuity on an ST.

I had this pair of programs a whiel back, though I seem to have deleted
them now. IIRC, they were called something like unix2st.ttp and
st2unix.ttp, and I got them from one of the usual FTP sites such as Hensa
(as was) or Umich.

Have not tried drag and drop. Most editors do it, but I still have and use
FLIP.TTP from Umich. Syntax is -m foobar.txt or -u foobar.txt, depending on
whether ATARI/MessyDos or Unix output is wanted.

Message-ID: <n9Ci2.20184$9S3.47035@nntpserver.swip.net>
Source record: 87335

Hi,
Can anyone tell me which color printers work with Ataris (and in which
programs), where I can find printerdrivers for various programs etc.?
I have a friend who's thinking of buying an Epson printer.
Are there any drivers available for Calamus(1.09 or SL), Cubase or GDOS?

Happy New Year!!!

MB> and experimented with a few different settings in HS Modem but must admit I
MB> don't know what I'm doing with that.

Well, the HS Modem settings shouldn't affect what Baud rate is
selected; STiK's DIAL.SCR setting should be enough... Err, you _do_
have MODEM.CPX disabled, don't you <G>?

MB> I used a 4040 chip for the upgrade as per an article in Atari World.
MB> I've checked and double checked all the connections, even tried a new chip,
MB> but it still doesn't want to play ball.

Hmmm... I can't help you on this bit :-}

MB> I noticed in the HS Modem Docs that it refers to MFP PRG.TXT which
MB> might give a bit more info, but I don't seem to have that with the package.

Try Derryck Croker's site for the full HS Modem docs:

http://www.cix.co.uk/~derryck/software.htm

But here are my HS Modem settings:

DRVIN.PRG:
FASTINT: Off (But switch 'On' if you're not using MagiC.)
EXOPEN: Off

MFP.PRG:
RSVE: Off (Switch 'On' if you need to use older progs.)
REPL: u (6x) (Put 'u' into each of the six fields here, unless
you have RSVE switched on. These are to re-map
baud rates e.g., >=38400 in MODEM.CPX.)
DTR: On
RBL: 256
TBL: 256

AFAIK you shouldn't need to switch RSVE 'On' if you're just using
STiK/NEWSie etc. The RBL/TBL values may need to be changed, but try
them as above first.

And just a double-check (you've probably got this bit OK already),
place DRVIN.PRG, MFP.PRG then STIKTSR.PRG in that order at the

hind-end of your AUTO folder :-)

MB> I would be glad of a bit of help from anybody who has upgraded their
MB> ST and could advise me what settings to alter in Stik and HS Modem.

Well, please feel free to shout at me if this is no use ;-)

Also, if you haven't already done so, setting your modem to report DCE
rate instead of DTE rate will tell you for sure if the upgrade is
working (I had to add 'W2' to my modem init string, somewhere after
the ATDT bit) :-)

Hi Kellis. Just wondering-I saw an Amiga file that used $ commands to
link multiple path lines into one. Would that work with Mint? If you
want, I'll find that article and post the example here... Later! ;-)

Well, I brought up the CD because there are certain demos on it that
are restricted from the public domain. Unfortunately, Tina is one of
those. ;(

Apparently, Tony Barker created it as part of a 6 minute commercial
that ran in Australia, using only Atari computers... It is pretty
impressive... ;-)

Terry, I think SFT is selling that CD for around $9.99 or so. Well
worth the price! ;-)

5530. Atari Scripture Program

Newsgroup: comp.sys.atari.st
Date: 1998-12-31 00:00:00 UTC
From: tconrardy@hotmail.com
Message-ID: <76fb0cbcm1@news.ncal.verio.com>
Source record: 87344

Hello All:

For those that did not know, there is an excellent Scripture Program for Atari ST/TT/Falcon computers. You get the entire KJV version and also the Greek N.T for comparison side by side. You can do word searches, Phrase search, show statistics on a word. Copy, paste verses for insertion into your documents.Several Utilities for converting entire books into ASCII Text. Even if you are not into Scripture stuff, it is neat to get for the sheer info.Looks great on a TT with the 19" monitor, but equally impressive in TT med. OF Coarse there are ST versions. All this is FREE from Spiritware:

http://www.halcyon.com/fabc/atarifiles.html

Just went to it with CAB to make sure the link was current.

I have really enjoyed this program. Every computer should have "the Bible-on-line". Atari is no exception. Check it out for yourself.

Q:Anybody else use this program? Any other scripture Programs out there for Atari?

Thanx and Enjoy...HAPPY NEW YEAR>>>SPACE 1999<<<<
